Introduction

This book covers the basics of statistics and R programming for linguists. It is based on various courses I have taught at both Newcastle University, Newcastle, UK during various workshops and mainly at the Université Paris Cité, Paris, France during my teaching at undergraduate and postgraduate levels.

You can use this reference for citation:

Al-Tamimi, J. (2025). *Statistics for Linguists using R - Quantitative and qualitative approaches*. Bookdown. <https://jalalal-tamimi.github.io/R-Stats-Linguistics-Book/>. Doi: <https://doi.org/10.5281/zenodo.17249197>.

The book is designed to be accessible to those with little or no prior experience in statistics or programming. The book applies these concepts to real-world examples from linguistics, including phonetics, syntax, and semantics. The book also includes exercises and solutions to help readers practice and reinforce their understanding of the material. The book is divided into four main parts.

The first part covered in **chapter 1** introduces the basics of the R programming language and the tidyverse universe. It covers data manipulation, data cleaning and an introduction to the basics of descriptive statistics. We end the part with data visualisation.

The second part focuses on statistical analyses using R covering inferential statistics, and hypothesis testing. This part aims to consolidate the reader's understanding of fundamental statistical concepts and how they can be applied using R and is composed of two chapters. In **chapter 2**, we cover type of outcomes and the best statistical models adapted to each type of outcome, and cover type of errors in statistical designs, including the classical Type I and Type II errors, and Type M and S errors. We also cover statistical power, and effect sizes. This part then covers correlations and three main family distributions, Gaussian (via linear models), Binomial (via GLM) and Cumulative (via Ordinal or likert scale data). We introduce the Signal Detection Theory concepts in a way that allows the reader to understand the various notions linked with STD and GLM models.

This part continues with the **chapter 3**, which introduces Random effects structures via mixed effects modelling. We cover the notions of random effects, ran-

dom intercepts and random slopes, and modelling strategies. We look at LMMs, GLMM, CLMM and GAMMs (for additive models).

The third part covers qualitative research methods using R. It is composed of three chapters and includes examples of where to find textual corpora and creating a corpus (in **chapter 4**), how to manipulate a corpus, including part of speech tagging (in **chapter 5**) and how to conduct statistical analyses of textual data including poisson regressions, network analyses and word clouds (in **chapter 6**).

The last part of the book is composed of two chapters and introduces the reader in **chapter 7** with various techniques used for dimensionality reduction, including correlations thresholds, Principal Component Analysis (PCA), cluster analysis and Multi Dimensional Scaling (MDS). **Chapter 8** covers the basics of machine learning, exploring issues related with regression analyses, and introducing solutions in terms of decision trees and Random Forests. We look at two different implementations of Random Forests, via Conditional Inference Trees and via the basic implementation using the **ranger** package, for a faster computation. We end the chapter by introducing the **tidymodels** philosophy.

The structure is organised with each chapter being dedicated to a specific topic and can normally be covered in 1 or 2 sessions.

It is hoped that this book allows students to specialise in the field of statistical analyses applied to linguistic data and to be able to use R for their own research. The book is designed to be a practical guide that can be used in the classroom or for self-study. It is hoped that this book will help students to develop the skills they need to conduct their own research and to understand the research of others.

Part I

Overview and basics of the R programming language

Chapter 1

Introduction to R, the Tidyverse - Visualisation

This chapter introduces you to the R programming language and its basics. We use it to create a dataframe, manipulate data, perform statistical analyses, and create visualisations.

We then move to the Tidyverse and how to visualise data using `ggplot2`. We will use the dataset `english` from the package `languageR`. This dataset contains reaction times for lexical decision and naming tasks, as well as familiarity ratings for 4568 English words. We use it to demonstrate how to manipulate data and create visualisations. We also obtain various descriptive statistics.

1.1 Loading packages

```
###Use the code below to check if you have all required packages installed. If some are not insta
requiredPackages = c('tidyverse', 'languageR', 'phonR', 'summarytools', 'ggdist', 'gtsummary', 'c
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p)
  library(p,character.only = TRUE)
}
```

```
## Loading required package: tidyverse
```

```
## -- Attaching core tidyverse packages ----- tidyverse 2.0.0 --
## v dplyr      1.1.4      v readr      2.1.6
## v forcats    1.0.1      v stringr    1.6.0
## v ggplot2    4.0.1      v tibble     3.3.0
## v lubridate  1.9.4      v tidyr      1.3.1
## v purrr      1.2.0
```

```
## -- Conflicts ----- tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts.
## Loading required package: languageR
##
## Loading required package: phonR
##
## Loading required package: summarytools
##
##
## Attaching package: 'summarytools'
##
##
## The following object is masked from 'package:tibble':
##
##     view
##
##
## Loading required package: ggdist
##
## Loading required package: gtsummary
##
## Loading required package: cardx
```

1.2 Intro R Markdown

1.2.1 General

This is an R Markdown Notebook. When you execute code within the notebook, the results appear beneath the code.

Try executing this chunk by clicking the *Run* button within the chunk or by placing your cursor inside it and pressing *Ctrl+Shift+Enter*.

```
plot(cars)
```

Add a new chunk by clicking the *Insert Chunk* button on the toolbar or by pressing *Ctrl+Alt+I*.

When you save the notebook, an HTML file containing the code and output will be saved alongside it (click the *Preview* button or press *Ctrl+Shift+K* to preview the HTML file).

The preview shows you a rendered HTML copy of the contents of the editor. Consequently, unlike *Knit*, *Preview* does not run any R code chunks. Instead, the output of the chunk when it was last run in the editor is displayed.

1.2.2 Knitting to other formats

You can knit notebook into PDF or Word. Make sure to install the `tinytex` package using the following code: `install.packages("tinytex")`. If you already use $\text{\LaTeX}$ with another distribution, then you do not need to install `tinytex` (though this works perfectly out of the bag). Then from the menu above (Knit), then choose **Knit to PDF** or **Knit to Word**. This is an excellent way to get your work fully written within RStudio: You will write a text (like this), have a specific structure and also have all your results in one place. This allows for transparency and replicability.

You may get an error message related to the default CRAN repository not being set up correctly. In this case, you will need to do the following:

1. Run the following code line: `usethis::edit_r_profile()`
2. Add the following to your profile: `options(repos = "https://cloud.r-project.org/")`
3. Restart your R distribution and then click on knit on the top

1.3 R and R Studio

1.3.1 R

R is the most influential statistical software that is widely used in data science. The R Project for Statistical Computing. R allows the user to take control of their analyses and being open about how the data were analysed, etc. R encourages transparency and reproducible research.

###Downloading base R

If you are a windows user, download the latest version here [R version 4.3.1](#). If you are a MacX user, download the latest version here [R version 4.3.1](#). Other Linux versions available here.

Using up-to-date versions of R is important as this allows you to use the latest developments of the software. You can have a look at what is new in this latest release here.

###Upgrading your current R installation

You can download the latest version from above and update. Or you can use the package `installr` and upgrade to the latest available version. If the package is not installed, use this: `install.packages("installr")` and then run with `library(installr)` then type `installr` in the console (what? what's a console?). We'll come to this later on!

1.3.2 R Studio

R Studio is one of the mostly used free and open-source integrated development environment for R. It allows the user to have access to various information at the same time, e.g., the **Source**, the **Console**, the **Environment** and the **Files**, etc. When you open **R studio**, and if you have installed R appropriately, then R Studio will “talk” to R by sending it messages to execute commands.

You can set up the layout to suit your needs. I always find the following layout best for my needs:

1. The **Source** pane: the file where you write your code
2. The **Console** where actual code is run
3. The **Environment** pane, which shows you all variables/datasets, with the history of executed code, etc.
4. The **Files/Viewer** pane, which shows you the files in the current folder, the plots, the installed packages, and help files, etc.

If you click on Tools and Global options, then Pane Layout, you can change the order, and add/remove options from the two panes below. You will see that I use a specific formatting as this suits me best and also have a special colour-coding used (Theme Modern et Editor theme = Tomorrow Night Bright). Use the theme that works best for you!!

1.3.3 Other options?

Text Editors

I use Sublime Text to run Python, Praat and write in $\text{\LaTeX}$. I use R Markdown in R to publish my code and write notebooks. I am in the process of writing my first article with R Markdown for a fully reproducible research.

There are many development environments that can be used to “talk” to R: TinnR, Visual Studio, etc...

R GUIs

GUIs (for Graphical User Interface) for R are available. I list below a few. However, after trying some, I found it much easier to get to code directly in R. I don’t remember all codes! I use these to my advantage, by saving my code into a script and using it later on in other scripts.

Some of the GUIs are meant to make R like excel or SPSS, while others are more specialised. Here is a list of some of these GUIs...

1. RCommander is the first GUI I used (and hated!). It is the one used in *Discovering Statistics using R* by Andy Field. There are compatibility issues between RCommander and RStudio... Install RCommander using `install.packages("Rcmdr")`. Then using R base, run RCommander from using `library(Rcmdr)`.
2. rattle is more of use for data mining and advanced statistics (use `library(rattle)` then `rattle()` to run)
3. Deducer. For basic and advanced statistics (run with `library(Deducer)` after installation)
4. RKWard. For basic and advanced statistics. Not available on CRAN and should be downloaded and installed.
5. Etc..

You can always start by using any of the above to familiarise yourself with the code, and then move to using R fully via code. My recommendation is to start coding first thing and search for help on how to write the specific code you are after.

1.4 Am I ready to use R now?

Well almost. There is one thing we need to consider: telling R where is our working directory. By default R saves this to your documents (or somewhere else). Here, this is generally OK, though when working on your own data, things get more complicated.

There are two schools of thought here. 1. Create R scripts that run the analyses and saves the output(s) directly to your working directory. Does not save the `.RData` image at the end 2. Create a project: a self-contained folder, where all

your scripts, figures, etc. will be automatically saved. Saves the `.RData` at the end

I subscribe to the second, as some of the computations I run take ages to finish.

1.4.1 Setting working directory

Click the menu **Session -> Set Workign Directory -> Choose Directory** or use `setwd("path/to/directory")` (choose the location where you want to save the results)

You can also use `getwd()` to know where is your current working directory.

1.4.2 Creating a project

Look at the top-right hand where you can see **Projects (none)**. You can create a new project in a new path or based on a specific folder.

1.5 How to use packages?

Base R comes with many packages already installed. Look at `packages` to see which ones are already installed. There are currently 23067 packages on Cran: see here (to check all packages and their status) (repository for all packages). No one uses all packages so do not try to install all of them. Simply install what you need!! RMarkdown will let you know if you are running a specific code that lacks a package and asks you to download it.

1.5.1 Installation

The best option is to use the menu above (under Tools) and click **Install packages**, or type in `install.packages("package.name")`. Make sure to always have **install dependencies** ticked (using the first option).

1.5.2 Loading

Use the following to load a package: `library(package.name)`. Once the package is loaded, you can use any of its functions directly into your code. Sometimes you may need to specify to use a particular function from within a particular package, in this case use: `package.name::function`. We will most probably not use this today, but this is something you need to know about otherwise undesirable results may occur (or even errors!).

1.5.3 Finding packages and help

Under the Files pane (right bottom), click on the menu **Packages** and you will have access to all **installed** packages. Click on a package and you can see the as-

sociated help files. You can also type the following to find help: `?package.name`.
`??function` e.g.,

```
?stats
```

```
## starting httpd help server ... done
```

```
??MASS
```

Or try clicking on the function name to find details of what to specify: e.g., scroll on `lmer` (assuming `lme4` is installed). Do a Ctrl/Cmd + left mouse click on a function to display options.

```
lme4::lmer
```

```
## function (formula, data = NULL, REML = TRUE, control = lmerControl(),
##      start = NULL, verbose = 0L, subset, weights, na.action, offset,
##      contrasts = NULL, devFunOnly = FALSE)
## {
##   mc <- mcout <- match.call()
##   missCtrl <- missing(control)
##   if (!missCtrl && !inherits(control, "lmerControl")) {
##     if (!is.list(control))
##       stop("'control' is not a list; use lmerControl()")
##     warning("passing control as list is deprecated: please use lmerControl() instead",
##           immediate. = TRUE)
##     control <- do.call(lmerControl, control)
##   }
##   mc$control <- control
##   mc[[1]] <- quote(lme4::lFormula)
##   lmod <- eval(mc, parent.frame(1L))
##   mcout$formula <- lmod$formula
##   lmod$formula <- NULL
##   if (is.matrix(y <- model.response(lmod$fr)) && ncol(y) >
##       1) {
##     stop("can't handle matrix-valued responses: consider using refit()")
##   }
##   devfun <- do.call(mkLmerDevfun, c(lmod, list(start = start,
##       verbose = verbose, control = control)))
##   if (devFunOnly)
##     return(devfun)
##   if (identical(control$optimizer, "none"))
##     stop("deprecated use of optimizer=='none'; use NULL instead")
##   opt <- if (length(control$optimizer) == 0) {
##     s <- getStart(start, environment(devfun)$pp)
##     list(par = s, fval = devfun(s), conv = 1000, message = "no optimization")
##   }
##   else {
```

```
##           optimizeLmer(devfun, optimizer = control$optimizer, restart_edge = control$
##           boundary.tol = control$boundary.tol, control = control$optCtrl,
##           verbose = verbose, start = start, calc.derivs = control$calc.derivs,
##           use.last.params = control$use.last.params)
##     }
##     cc <- checkConv(attr(opt, "derivs"), opt$par, ctrl = control$checkConv,
##                   lbound = environment(devfun)$lower)
##     mkMerMod(environment(devfun), opt, lmod$reTrms, fr = lmod$fr,
##              mc = mcout, lme4conv = cc)
##   }
## <bytecode: 0x000002c961f2e0b0>
## <environment: namespace:lme4>
```

1.6 Let's get started with R

1.6.1 R as a calculator

1.6.1.1 Simple calculations

R can be used as a calculator. Try some of the following below:

```
1 + 2
```

```
## [1] 3
```

```
1+2*3
```

```
## [1] 7
```

Well wait a second! were you all expecting the result to be 7? how many expected the result to be 9?

Check the following:

```
(1+2)*3
```

```
## [1] 9
```

```
1+(2*3)
```

```
## [1] 7
```

So parenthesis are important! Always use these to tell R (and any other software) the order of operations. This is the order (remember PEMDAS):

1. Parentheses
2. Exponents
3. Multiplication and Division (from left to right)
4. Addition and Subtraction (from left to right)

1.6.1.2 Functions

There are many built-in functions in R to do some complicated mathematical calculations.

1.6.1.2.1 Basic functions Run some of the following.

```
sqrt(3)
```

```
## [1] 1.732051
```

```
3^2
```

```
## [1] 9
```

```
log(3)
```

```
## [1] 1.098612
```

```
exp(3)
```

```
## [1] 20.08554
```

1.6.1.2.2 Creating variables We can also create variables (aka temporary place holders).

```
x <- 2  
y <- 5  
b <- x*y  
x
```

```
## [1] 2
```

```
y
```

```
## [1] 5
```

```
b
```

```
## [1] 10
```

```
b+log(y)*x^2
```

```
## [1] 16.43775
```

When you create a variable and assign to it a number (or characters), you can use it later on.

1.6.1.2.3 Sequences We can also create sequences of numbers

```
seq(1, 10, 2)
```

```
## [1] 1 3 5 7 9
```

```
?seq
```

```
z <- 1:10
```

And we can do the following.. Can you explain what we have done here?

```
z2 <- z+1
z*z2
```

```
## [1] 2 6 12 20 30 42 56 72 90 110
```

Up to you... Write some more complex maths here just for fun!

```
## Add below
```

1.6.2 Objects

1.6.2.1 Basic objects

Objects are related to variables (we created above), but can also be dataframes, and other things we create in R. All of these are stored in memory and are shown below (under environment). You can check the type of the “object” below in the list (look at “Type”) or by using `class()`.

Let’s look at the variables we created so far.. We will create another one as well...

```
class(b)
```

```
## [1] "numeric"
```

```
class(x)
```

```
## [1] "numeric"
```

```
class(y)
```

```
## [1] "numeric"
```

```
class(z)
```

```
## [1] "integer"
```

```
class(z2)
```

```
## [1] "numeric"
```

```
a <- "test"
```

```
class(a)
```

```
## [1] "character"
```

When we do calculations in R, we need to make sure we use numeric/integer variables only.. Try some of the below. Uncomment the following `##x + two` and run the code.

```
x+y
```

```
## [1] 7
```

```
two <- "2"
```

```
##x + two
```

Can you explain the error?

We have tried to add a number to a (character) string which is clearly impossible. To do the maths, we need to change the class using any of the following commands: `as.character`, `as.integer`, `as.numeric`, `as.factor`, e.g.:

```
two <- as.numeric(two)
```

```
x + two
```

```
## [1] 4
```

1.6.2.2 Other functions and objects

1.6.2.2.1 Some more calculations We can create a vector of objects to do various things on.. We use the function `c()` and do various things on:

```
numbers <- c(1,4,5,12,55,13,45,38,77,836,543)
```

```
class(numbers)
```

```
## [1] "numeric"
```

```
mean(numbers)
```

```
## [1] 148.0909
```

```
sd(numbers)
```

```
## [1] 276.6375
```

```
median(numbers)
```

```
## [1] 38
```

```
min(numbers)
```

```
## [1] 1
```

```
max(numbers)
```

```
## [1] 836
```

```
range(numbers)
```

```
## [1] 1 836
```

```
sum(numbers)
```

```
## [1] 1629
```

1.6.2.2.2 Referring to a specific position Sometimes we may want to refer to a specific position in the list of numbers we just created... Use the following:

```
numbers[2]
```

```
## [1] 4
```

```
numbers[3:5]
```

```
## [1] 5 12 55
```

```
numbers[-4]
```

```
## [1] 1 4 5 55 13 45 38 77 836 543
```

```
numbers+numbers[6]
```

```
## [1] 14 17 18 25 68 26 58 51 90 849 556
```

Can you explain what we have done in the last operation?

1.7 Matrices and dataframes

1.7.1 Matrix

1.7.1.1 General

```
x <- 1:4
x <- as.matrix(x)
x
```

```
##      [,1]
## [1,]    1
## [2,]    2
## [3,]    3
## [4,]    4
```

```
dim(x)
```

```
## [1] 4 1
```

```
dim(x) <- c(2,2)
```

```
dim(x)
```

```
## [1] 2 2
```

```
x

##      [,1] [,2]
## [1,]    1    3
## [2,]    2    4
```

1.7.1.2 Referring to specific location

```
x[1,]
```

```
## [1] 1 3
```

```
x[,1]
```

```
## [1] 1 2
```

```
x[1,2]
```

```
## [1] 3
```

```
x[,] ## = x
```

```
##      [,1] [,2]
## [1,]    1    3
## [2,]    2    4
```

1.7.2 Dataframes

A dataframe is the most important object we will be using over and over again... It is an object that contains information in both rows and columns.

1.7.2.1 Creating a dataframe from scratch

In this exercise, we will create a 4*9 dataframe. The code below creates four variables, and combines them together to make a dataframe. As you can see, variables can also be characters. To create the dataframe, we use the functions `as.data.frame` and `cbind`.

```
word <- c("a", "the", "lamp", "not", "jump", "it", "coffee", "walk", "on")
freq <- c(500, 600, 7, 200, 30, 450, 130, 33, 300) ## note this is completely made up!!
functionword <- c("y", "y", "n", "y", "n", "y", "n", "n", "y")
length <- c(1, 3, 4, 3, 4, 2, 6, 4, 2)
df <- as.data.frame(cbind(word,freq,functionword,length))
```

1.7.2.2 Deleting variables from the Environment

If you have created various variables you do not need any more, you can use `rm` to remove these

```
rm(word,freq,functionword,length)
```

BUT wait, did I remove these from my dataframe? Well no.. We have removed objects from within the R environment and not from the actual dataframe. Let's check this up

```
df
```

```
##      word freq functionword length
## 1      a  500             y      1
## 2     the  600             y      3
## 3    lamp   7             n      4
## 4     not  200             y      3
## 5    jump   30             n      4
## 6      it  450             y      2
## 7 coffee  130             n      6
## 8    walk   33             n      4
## 9      on  300             y      2
```

1.7.2.3 Saving and reading the dataframe

1.7.2.4 Reading and Saving in .csv

The code below allows you to save the dataframe and read it again. The extension .csv is for “comma delimited files”. This is the best format to use as it is simply a text file with no additional formatting.

```
write.csv(df, paste0("outputs/df.csv"))
dfNew <- read.csv(paste0("outputs/df.csv"))
df
```

```
##      word freq functionword length
## 1      a  500             y      1
## 2     the  600             y      3
## 3    lamp   7             n      4
## 4     not  200             y      3
## 5    jump   30             n      4
## 6      it  450             y      2
## 7 coffee  130             n      6
## 8    walk   33             n      4
## 9      on  300             y      2
```

```
dfNew
```

```
##   X      word freq functionword length
## 1 1      a  500             y      1
## 2 2     the  600             y      3
## 3 3    lamp   7             n      4
## 4 4     not  200             y      3
```

```
## 5 5   jump   30           n     4
## 6 6     it  450           y     2
## 7 7 coffee 130           n     6
## 8 8   walk   33           n     4
## 9 9     on  300           y     2
```

The newly created object contains 5 columns rather than the 4 we initially created. This is normal. By default, R add a column that reflects the order of the list *before* it was saved. You can simply delete the column or keep as is (but be careful as this means you need to adjust any references to columns that we will use later on).

1.7.2.5 Reading and saving other formats

R allows us to read data in any format. If you have a `.txt`, `.sav`, `.xls`, `.xlsx`, etc., then there are packages specific to do that (e.g., package `xlsx` to read/save `.xlsx` files, or the function `haven` from the package `Tidyverse` to read/save `.sav` files).

You can use the built-in plugin in **RStudio** to **import** your dataset. See **Import Dataset** within the **Environment**.

In general, any specific formatting is kept, but sometimes variable names associated with numbers (as in `.sav` files) will be lost. Hence, it is always preferable to do minimal formatting on the data.. Start with a `.csv` file, import it to R and do the magic!

1.7.2.6 Checking the structure

The first thing we will do is to check the structure of our created dataset. We will use the originally created one (i.e., `df` and not the imported one (i.e., `dfNew`).

```
str(df)

## 'data.frame':   9 obs. of  4 variables:
## $ word          : chr  "a" "the" "lamp" "not" ...
## $ freq          : chr  "500" "600" "7" "200" ...
## $ functionword  : chr  "y" "y" "n" "y" ...
## $ length        : chr  "1" "3" "4" "3" ...
```

The function `str` gives us the following information:

1. How many observations (i.e., rows) and variables (i.e., columns)
2. The name of each variable (look at `$` and what comes after it)
3. Within each variable, we have the class with number of levels

1.7.2.7 Changing the class of a variable

As we can see, the four created variables were added to the dataframe as **factors**. We need to change the **class** of the **numeric** variables: `freq` and `length`. Let's

do that:

```
df$freq <- as.numeric(df$freq)
df$length <- as.numeric(df$length)
str(df)
```

```
## 'data.frame': 9 obs. of 4 variables:
## $ word : chr "a" "the" "lamp" "not" ...
## $ freq : num 500 600 7 200 30 450 130 33 300
## $ functionword: chr "y" "y" "n" "y" ...
## $ length : num 1 3 4 3 4 2 6 4 2
```

1.7.2.8 Referring to particular variables, observations

As you can see from the above, we can refer to a particular variable in the dataframe by its name and adding \$. There are additional options to do that. Let's see what we can do. Can you tell what each of the below does? chat to your neighbour....

```
df[1]
```

```
##      word
## 1      a
## 2     the
## 3    lamp
## 4     not
## 5    jump
## 6      it
## 7 coffee
## 8    walk
## 9      on
```

```
df[,1]
```

```
## [1] "a"      "the"    "lamp"   "not"    "jump"   "it"     "coffee" "walk"
## [9] "on"
```

```
df[1,]
```

```
##   word freq functionword length
## 1   a  500           y       1
```

```
df[1,1]
```

```
## [1] "a"
```

Here are the answers:

1. Refers to the full column 1
2. Refers to first variable
3. Refers to first row

4. Refers to first observation in first column

Practice a bit and use other specifications to obtain specific observations, columns or rows...

1.7.3 Descriptive statistics

1.7.3.1 Basic summaries, tables

We can use the function `summary` to do some basic summaries

```
summary(df)
```

```
##      word                freq  functionword      length
## Length:9           Min.   : 7  Length:9       Min.    :1.000
## Class :character   1st Qu.: 33  Class :character 1st Qu.:2.000
## Mode  :character   Median :200  Mode  :character Median :3.000
##                      Mean  :250          Mean  :3.222
##                      3rd Qu.:450          3rd Qu.:4.000
##                      Max.   :600          Max.    :6.000
```

We can create a table with the function `table`

```
table(df$functionword, df$freq)
```

```
##
##      7 30 33 130 200 300 450 500 600
##  n 1  1  1  1  0  0  0  0  0
##  y 0  0  0  0  1  1  1  1  1
```

1.7.3.2 Basic manipulations

1.7.3.2.1 Creating variables We sometimes need to create and/or delete new variables.. Do you know how to do that?

Let's look at the structure again:

```
str(df)
```

```
## 'data.frame':    9 obs. of  4 variables:
##  $ word          : chr  "a" "the" "lamp" "not" ...
##  $ freq          : num  500 600 7 200 30 450 130 33 300
##  $ functionword: chr   "y" "y" "n" "y" ...
##  $ length       : num   1 3 4 3 4 2 6 4 2
```

We said earlier that we can refer to a specific variable by using `$` + the name of the variable. Let's use this again and add a new name of variable not in the list of variables above

```
df$newVariable
```

```
## NULL
```

What does NULL mean? The variable does not exist! Let's do something else

```
df$newVariable <- NA
```

Ah no error messages! Let's check the structure

```
str(df)
```

```
## 'data.frame':    9 obs. of  5 variables:
## $ word          : chr  "a" "the" "lamp" "not" ...
## $ freq          : num  500 600 7 200 30 450 130 33 300
## $ functionword: chr  "y" "y" "n" "y" ...
## $ length        : num  1 3 4 3 4 2 6 4 2
## $ newVariable   : logi  NA NA NA NA NA NA ...
```

So we now have five variables and the last one is named “newVariable” and assigned “NA”. “NA” is used in R to refer to missing data or is a place holder. We can replace these with any calculations, or anything else. Let's do that:

```
df$newVariable <- log(df$freq)
str(df)
```

```
## 'data.frame':    9 obs. of  5 variables:
## $ word          : chr  "a" "the" "lamp" "not" ...
## $ freq          : num  500 600 7 200 30 450 130 33 300
## $ functionword: chr  "y" "y" "n" "y" ...
## $ length        : num  1 3 4 3 4 2 6 4 2
## $ newVariable   : num  6.21 6.4 1.95 5.3 3.4 ...
```

We replaced “NA” with the log of the frequencies. Let's check that this is correct only for one observation. Can you dissect the code below? what did I use to ask R to compute the log of the frequency (freq)? Remember rows and columns

```
log(df[1,2])
```

```
## [1] 6.214608
```

```
df[1,5]
```

```
## [1] 6.214608
```

So they are the same values.

1.7.3.2.2 Changing column names Now we need to change the name of the variable to reflect the computations. “newVariable” is meaningless as a name, but “logFreq” is informative.

```
colnames(df)[5] <- "logFreq"
str(df)
```

```
## 'data.frame':    9 obs. of  5 variables:
## $ word          : chr  "a" "the" "lamp" "not" ...
```

```
## $ freq      : num  500 600 7 200 30 450 130 33 300
## $ functionword: chr  "y" "y" "n" "y" ...
## $ length    : num  1 3 4 3 4 2 6 4 2
## $ logFreq   : num  6.21 6.4 1.95 5.3 3.4 ...
```

As can be seen from the above, using the command `colnames(df)[5] <- "logFreq"` allows us to change the column name in position 5 of the dataframe. If we were to change all of the columns names, we could use `colnames(df) <- c("col1", "col2", ...)`.

1.7.3.2.3 Deleting variables Let us now create a new compound variable that we later delete. This new compound variable will be the multiplication of two numeric variables. The result is meaningless of course, but will be used for this exercise.

```
df$madeUpVariable <- df$freq*df$length
str(df)

## 'data.frame':  9 obs. of  6 variables:
## $ word      : chr  "a" "the" "lamp" "not" ...
## $ freq      : num  500 600 7 200 30 450 130 33 300
## $ functionword : chr  "y" "y" "n" "y" ...
## $ length    : num  1 3 4 3 4 2 6 4 2
## $ logFreq   : num  6.21 6.4 1.95 5.3 3.4 ...
## $ madeUpVariable: num  500 1800 28 600 120 900 780 132 600
```

Let us now delete this variable given that we are not interested in. Do you know how to do that? Think about how we referred to a variable before? We use `df[colNumber]`. What if we use `df[-colNumber]`, what would be the result?

```
df[-6]

##      word freq functionword length  logFreq
## 1      a  500             y      1 6.214608
## 2     the  600             y      3 6.396930
## 3    lamp    7             n      4 1.945910
## 4     not  200             y      3 5.298317
## 5    jump   30             n      4 3.401197
## 6      it  450             y      2 6.109248
## 7 coffee  130             n      6 4.867534
## 8    walk   33             n      4 3.496508
## 9      on  300             y      2 5.703782
```

This shows all columns *minus* the one we are not interested in. If we rewrite the variable `df` and assign to it the newly created dataframe we just used above (with the minus sign), then the column we are not interested in will be deleted.

```
df <- df[-6]
str(df)
```

```
## 'data.frame':    9 obs. of  5 variables:
## $ word          : chr  "a" "the" "lamp" "not" ...
## $ freq          : num  500 600 7 200 30 450 130 33 300
## $ functionword: chr  "y" "y" "n" "y" ...
## $ length        : num  1 3 4 3 4 2 6 4 2
## $ logFreq       : num  6.21 6.4 1.95 5.3 3.4 ...
```

1.7.3.2.4 Changing names of observations Let's say that we want to change the names of our observations. For instance, the variable “functionword” has the levels “y” and “n”. Let us change the names to become “yes” and “no”. We first need to change the factor level variable into character and then change the observations. Then we need to transform back to a factor

```
df$functionword <- as.character(df$functionword)
df$functionword[df$functionword == "y"] <- "yes"
df$functionword[df$functionword == "n"] <- "no"
df$functionword <- as.factor(df$functionword)
str(df)
```

```
## 'data.frame':    9 obs. of  5 variables:
## $ word          : chr  "a" "the" "lamp" "not" ...
## $ freq          : num  500 600 7 200 30 450 130 33 300
## $ functionword: Factor w/ 2 levels "no","yes": 2 2 1 2 1 2 1 1 2
## $ length        : num  1 3 4 3 4 2 6 4 2
## $ logFreq       : num  6.21 6.4 1.95 5.3 3.4 ...
```

1.7.3.2.5 Checking levels of factors We can also check the levels of factor and change the reference value. This is useful when doing any type of statistics or when plotting the data. We use `levels`, `relevel` and `ref`

```
levels(df$functionword)
```

```
## [1] "no" "yes"
```

```
df$functionword <- relevel(df$functionword, ref = "yes")
levels(df$functionword)
```

```
## [1] "yes" "no"
```

We can also use the following code to change the order of the levels of a multilevel factor

```
levels(df$word)
```

```
## NULL
```

```
df$word <- factor(df$word, levels = c("a","coffee","jump","lamp","not","it","on","walk"))
levels(df$word)
```

```
## [1] "a"          "coffee" "jump"    "lamp"    "not"     "it"      "on"      "walk"
```

```
## [9] "the"
```

1.7.3.2.6 Subsetting the dataframe We may sometimes need to subset the dataframe and use parts of it. We use the function `subset` or `which`.

```
df_Yes1 <- df[which(df$functionword == 'yes'),]
##or
df_Yes2 <- subset(df, functionword=="yes")
str(df_Yes1)
```

```
## 'data.frame':  5 obs. of  5 variables:
## $ word      : Factor w/ 9 levels "a","coffee","jump",...: 1 9 5 6 7
## $ freq      : num  500 600 200 450 300
## $ functionword: Factor w/ 2 levels "yes","no": 1 1 1 1 1
## $ length    : num  1 3 3 2 2
## $ logFreq    : num  6.21 6.4 5.3 6.11 5.7
str(df_Yes2)
```

```
## 'data.frame':  5 obs. of  5 variables:
## $ word      : Factor w/ 9 levels "a","coffee","jump",...: 1 9 5 6 7
## $ freq      : num  500 600 200 450 300
## $ functionword: Factor w/ 2 levels "yes","no": 1 1 1 1 1
## $ length    : num  1 3 3 2 2
## $ logFreq    : num  6.21 6.4 5.3 6.11 5.7
```

When we subset the data, the levels of a factor are kept as they are.

```
levels(df_Yes1$functionword)
```

```
## [1] "yes" "no"
```

```
levels(df_Yes2$functionword)
```

```
## [1] "yes" "no"
```

But we only have one level of our factor..

```
df_Yes1$functionword
```

```
## [1] yes yes yes yes yes
## Levels: yes no
```

```
df_Yes2$functionword
```

```
## [1] yes yes yes yes yes
## Levels: yes no
```

By default, R keeps the levels of the factor as they are unless we change it by using the following:

```
df_Yes1$functionword <- factor(df_Yes1$functionword)
df_Yes2$functionword <- factor(df_Yes2$functionword)
df_Yes1$functionword
```

```
## [1] yes yes yes yes yes
## Levels: yes
```

```
df_Yes2$functionword
```

```
## [1] yes yes yes yes yes
## Levels: yes
```

1.8 The Tidyverse

1.8.1 Introduction

The Tidyverse is a family of packages used to speed up the use of R.

The tidyverse

Components

The tidyverse is a collection of R packages that share common philosophies and are designed to work together. This site is a work-in-progress guide to the tidyverse and its packages.

You need to first install it (if you haven't already done so) and then load it. To install, use **Tools > Install packages** or `install.packages()` then add tidyverse. To load a package, use the `library()` function.

Look at how many packages are installed within the **Tidyverse**. The messages you see are telling you which packages are loaded and which functions are in conflict (i.e., these are functions from other packages that are found within the **Tidyverse**). If you want to use the original function, simply add `package_name::function`.

1.8.2 Using piping

The difference between base R and the Tidyverse's way of doing things is that base R can sometimes be more complex, while tidyverse is more straightforward and allows you to “see” within a dataframe easily. You need to learn how to use the “pipe” in **magrittr** that is part of the **Tidyverse**.

Pipes are written in R as `%>%` (note you must use a percentage sign before and after the pipe). To demonstrate what pipes do, have a look at the following pseudo code. You can use a shortcut in your keyboard, type `Ctrl+Shift+m` to add a `pipe` (for mac users, it is `Cmd+Shift+m`).

```
data_frame <- function(data_frame, another_argument)
```

```
data_frame %>% function(another_argument)
```

Since R version 4.1.0, there is a native pipe `|>`. It seems to be doing almost

the same thing as the `%>%`. We will still use `%>%` as this is integrated within the `Tidyverse`.

1.8.3 Demo subsetting

Below are two code lines for how to subset the dataframe using base R and piping from the `magrittr` package.

With base R, we always need to refer to the dataset twice: once at the beginning and then to look into the dataset to select a variable.

```
df_Yes1 <- df[which(df$functionword == 'yes'),]
df_Yes1
```

```
## word freq functionword length logFreq
## 1 a 500 yes 1 6.214608
## 2 the 600 yes 3 6.396930
## 4 not 200 yes 3 5.298317
## 6 it 450 yes 2 6.109248
## 9 on 300 yes 2 5.703782
```

With the pipe, you only need to specify the dataset once: By adding the pipe, you can already look into the dataset and select the variable you need.

```
df %>% filter(functionword == 'yes')
```

```
## word freq functionword length logFreq
## 1 a 500 yes 1 6.214608
## 2 the 600 yes 3 6.396930
## 3 not 200 yes 3 5.298317
## 4 it 450 yes 2 6.109248
## 5 on 300 yes 2 5.703782
```

And this is with the base R pipe (combined with code from the `Tidyverse` family)

```
df |> filter(functionword == 'yes')
```

```
## word freq functionword length logFreq
## 1 a 500 yes 1 6.214608
## 2 the 600 yes 3 6.396930
## 3 not 200 yes 3 5.298317
## 4 it 450 yes 2 6.109248
## 5 on 300 yes 2 5.703782
```

As you can see, using the pipe (either within the `Tidyverse` or with base R) is a quick and easy way to do various operations.

Out of convenience and because we will use other packages integrated within the `Tidyverse`, we will use its pipe.

ReCap:

- `%>%` is called a “pipe”
- It passes the previous line into the `data` argument of the next line
- It **does not save any changes** after output
- If you want to save the output of a particular manipulation, simply save it with `xx <-`

1.8.4 Basic manipulations

We will use the pipe with the `Tidyverse` to obtain summaries. We will use an R built-in dataset. Type `data()` to see the full list of datasets installed by default in R. You can use `data(package = .packages(all.available = TRUE))` to see all datasets installed within all packages.

1.8.4.1 First steps

Here is a list of all available datasets

```
data()
data(package = .packages(all.available = TRUE))
```

1.8.4.2 Loading dataset

We will use the dataset `english` from the package `languageR`. This is a package that contains many linguistically-oriented datasets. See details of the dataset [here](#). Or by typing `?languageR::english` (or simply `?english` if the package is already loaded) in the console.

You can load the dataset after loading the package. Simply refer to it by its name.

```
?english
```

1.8.4.3 View

To see the dataset, run the code below to visualise it.

```
english %>%
  View()
```

1.8.4.4 Structure

We can use `str()` to look at the structure of the dataset. Here we have a relatively large dataset with 4568 observations (=rows) and 36 variables (=columns).

```
english %>%
  str()
```

```
## 'data.frame':    4568 obs. of  36 variables:

1.8.4.7 Selecting variables

Here, we select a few variables to use. For `variables` or `columns`, use the function `select`

```
english %>%
  select(RTlexdec, RTnaming, Familiarity) %>%
  head(10)
```

```
##      RTlexdec RTnaming Familiarity
## 1  6.543754 6.145044      2.37
## 2  6.397596 6.246882      4.43
## 3  6.304942 6.143756      5.60
## 4  6.424221 6.131878      3.87
## 5  6.450597 6.198479      3.93
## 6  6.531970 6.167726      3.27
## 7  6.370586 6.123808      3.73
## 8  6.266859 6.096050      5.67
## 9  6.608648 6.117657      3.10
## 10 6.284843 6.179188      4.43
```

1.8.4.8 Selecting observations

If we want to select observations, we use the function `filter`. We will use `select` to select particular variables and then use `filter` to select specific observations. This example shows how the pipe chain works, by combining multiple functions and using pipes

```
english %>%
  select(RTlexdec, RTnaming, Familiarity, AgeSubject) %>%
  filter(AgeSubject == "old") %>%
  head(10)
```

```
##      RTlexdec RTnaming Familiarity AgeSubject
## 1453 6.664894 6.422597      2.37      old
## 1454 6.677209 6.636603      4.43      old
## 1455 6.538617 6.487075      5.60      old
## 1456 6.546943 6.404402      3.87      old
## 1457 6.637428 6.423409      3.93      old
## 1458 6.757444 6.529273      3.27      old
## 1459 6.598073 6.471728      3.73      old
## 1460 6.572464 6.424058      5.67      old
## 1461 6.817349 6.470645      3.10      old
## 1462 6.662877 6.549937      4.43      old
```

1.8.4.9 Changing order of levels

Use some of the code above to manipulate the dataframe but now using code from the **Tidyverse**. As you will see, once you know how to manipulate a dataset with base R, you can easily apply the same techniques with the **Tidyverse**. The **Tidyverse** provides additional ways to manipulate a dataframe.

For example, if I want to check levels of a variable and change the reference level, I will use the following code

```
levels(english$AgeSubject)
```

```
## [1] "old" "young"
```

To change levels of `AgeSubject`, we need to save a new dataset (do not override the original dataset!!). The `mutate` function means we are manipulating an object.

```
english2<- english %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old")))
levels(english2$AgeSubject)
```

```
## [1] "young" "old"
```

1.8.4.10 Changing reference value

You can change the reference value by using `fct_relevel`. This is useful if you have many levels in one of the factors you are working with and you simply need to change the reference.

```
english2 <- english %>%
  mutate(AgeSubject = fct_relevel(AgeSubject, "old"))
levels(english2$AgeSubject)

## [1] "old" "young"
```

1.8.5 String manipulation

We use the `str_func` variants from the `stringr` package within the Tidyverse.

```
topics <- c("Phonetics", "Phonology", "Morphology", "Syntax", "Semantics", "Pragmatics", "Psycholinguistics")
```

1.8.5.1 str_sub

Extracting substrings (2nd to 4th)

```
str_sub(topics, 2, 4)
```

```
## [1] "hon" "hon" "orp" "ynt" "ema" "rag" "syc"
```

1.8.5.2 str_detect

Detecting a particular pattern

```
str_detect(topics, "p")
```

```
## [1] FALSE FALSE TRUE FALSE FALSE FALSE FALSE
```

```
str_detect(topics, "n")
```

```
## [1] TRUE TRUE FALSE TRUE TRUE FALSE TRUE
```

```
str_detect(topics, "pho")
```

```
## [1] FALSE FALSE TRUE FALSE FALSE FALSE FALSE
```

```
str_detect(topics, "ling")
```

```
## [1] FALSE FALSE FALSE FALSE FALSE FALSE TRUE
```

1.8.5.3 str_locate

Locate specific characters

```
str_locate(topics, "n")
```

```
##      start end
## [1,]     4   4
## [2,]     4   4
## [3,]    NA  NA
## [4,]     3   3
```

```
## [5,]      5  5
## [6,]     NA NA
## [7,]      9  9
```

1.8.5.4 str_locate_all

Locate all instances of characters

```
str_locate_all(topics, "n")
```

```
## [[1]]
##      start end
## [1,]      4  4
##
## [[2]]
##      start end
## [1,]      4  4
##
## [[3]]
##      start end
##
## [[4]]
##      start end
## [1,]      3  3
##
## [[5]]
##      start end
## [1,]      5  5
##
## [[6]]
##      start end
##
## [[7]]
##      start end
## [1,]      9  9
```

1.8.5.5 str_replace

replaces a single instance

```
str_replace(topics, "o", "0")
```

```
## [1] "Ph0netics"      "Ph0nology"      "M0rphology"
## [4] "Syntax"         "Semantics"       "Pragmatics"
## [7] "Psych0linguistics"
```

1.8.5.6 str_replace_all

replaces all instances

```
str_replace_all(topics, "o", "0")
```

```
## [1] "Phonetics"      "Phonology"      "Morphology"
## [4] "Syntax"         "Semantics"      "Pragmatics"
## [7] "Psycholinguistics"
```

1.8.6 Regular expressions

Regular expressions are wildcards that can be used to search for particular patterns. We can use them to identify all words that begin with a “p” or end with a “y” or “cs”? Or any other changes? You can already consult this cheat sheet. Also, here

Basic Regular Expressions in R

Cheat Sheet

Character Classes

```
[[digit]] => \d Digits; [0-9]
\\D Non-digits; [^0-9]
\\lower [a-z] Lower-case letters; [a-z]
\\upper [A-Z] Upper-case letters; [A-Z]
\\alpha [a-zA-Z] Alphabetic characters; [a-zA-Z]
\\alnum [a-zA-Z0-9_] Alphanumeric characters; [a-zA-Z0-9_]
\\w Word characters; [a-zA-Z0-9_]
\\W Non-word characters
\\xdigit [a-fA-F0-9] Hexadecimal digits; [a-fA-F0-9]
\\space [ ] Space and tab
\\s [ ] Space, tab, vertical tab, newline, form feed, carriage return
\\S [^ ] Not space; [^ ]
\\punc [.,:;@%&'()*~+-=^_`{|}~] Punctuation characters; [.,:;@%&'()*~+-=^_`{|}~]
\\graph [A-Za-z0-9_!@#$%^&*~+-=^_`{|}~] Graphical characters; [A-Za-z0-9_!@#$%^&*~+-=^_`{|}~]
\\print [A-Za-z0-9_!@#$%^&*~+-=^_`{|}~] Printable characters; [A-Za-z0-9_!@#$%^&*~+-=^_`{|}~]
\\cntrl [\\t\\b\\n\\f\\r\\c] Control characters; [\\t\\b\\n\\f\\r\\c]
```

Special Metacharacters

```
%n New line
%r Carriage return
%t Tab
%v Vertical tab
%f Form feed
```

Lookaheads and Conditionals*

```
(?=) Lookahead (requires PERL = TRUE).
      (?=xyz) position followed by "xyz"
(?! ) Negative lookahead (PERL = TRUE).
      (?!xyz) Not followed by "xyz"
(?=xyz) Lookbehind (PERL = TRUE). e.g.
      (?=xyz) position followed by "xyz"
(?!xyz) Negative lookahead (PERL = TRUE).
      (?!xyz) Not following pattern
(?=xyz) Lookbehind (PERL = TRUE).
      if then condition (PERL = TRUE): use
      lookaheads, optional char etc in if clause
(?=xyz) if then else condition (PERL = TRUE)
      if then else condition (PERL = TRUE)
      http://www.regexp.org/doc/regexp/lookahead/lookahead.html
```

Detect pattern

Locate pattern

Extract pattern

Replace pattern

Detect Patterns

```
grep(pattern, string)
# [1] 3
grep(pattern, string, value = TRUE)
# [1] "Hippopotamus", "Rhinoceros", "time for bottomless lyrics"
# [2] "time for bottomless lyrics"
grep(pattern, string, perl = TRUE)
# [1] TRUE FALSE TRUE
stringr::grep(pattern, string)
# [1] TRUE FALSE TRUE
```

Split a String using a Pattern

```
strsplit(string, pattern) or stringr::str_split(string, pattern)
```

Locate Patterns

```
regexpr(pattern, string)
# [1] 1
# [2] 1
# [3] 1
# [4] 1
# [5] 1
# [6] 1
# [7] 1

# [325] 1

```

1.8.6.1 Initial and final

^ used to identify initial position \$ used to identify final position

```
str_detect(topics, "[Pp]")
```

```
## [1] TRUE TRUE FALSE FALSE FALSE TRUE TRUE
```

```
str_detect(topics, "[y]$")

## [1] FALSE TRUE TRUE FALSE FALSE FALSE FALSE
str_detect(topics, "[cs]$")

## [1] TRUE FALSE FALSE FALSE TRUE TRUE TRUE
```

1.8.6.2 Other characters

The `.` is used as a place holder asking for any character in the sequence

```
str_detect(topics, "Ph.n")

## [1] TRUE TRUE FALSE FALSE FALSE FALSE FALSE
[a-z] will detect all characters between “a” and “z”
str_detect(topics, "[a-z]")
```

```
## [1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE
[M-P] will detect all characters between “M” and “P”
str_detect(topics, "[M-P]")
```

```
## [1] TRUE TRUE TRUE FALSE FALSE TRUE TRUE
[:lower:] will detect all characters in lower case
str_detect(topics, "[:lower:]")
```

```
## [1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE
str_detect(topics, "[:upper:]")
```

```
## [1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE
```

We can also use “[0-9]”, “[digit:]”, “[alpha:]”, “[alnum:]”, “[punct:]”, “[graph:]”, “[blank:]”, “[space:]”, “[print:]”, etc.. See PDF of cheat sheet!

1.8.7 Advanced manipulations

Sometimes, you may have a dataset that comes in a wide format (i.e., columns contain data from participants) and you want to change to long format (i.e., each row contains one observation with minimal number of columns). Let’s look at the functions `pivot_longer` and `pivot_wider`

1.8.7.1 Columns to rows

Let’s use the `english` dataset to transform it from wide to long and see the first 10 rows.

```

english %>%
  select(Word, RTlexdec, RTnaming, Familiarity) %>%
  pivot_longer(cols = c(RTlexdec, RTnaming, Familiarity), ## you can also add index, i.e., 2:4
               names_to = "variable",
               values_to = "values") %>%
  head(10)

```

```

## # A tibble: 10 x 3
##   Word   variable   values
##   <fct> <chr>      <dbl>
## 1 doe   RTlexdec      6.54
## 2 doe   RTnaming      6.15
## 3 doe   Familiarity   2.37
## 4 whore RTlexdec      6.40
## 5 whore RTnaming      6.25
## 6 whore Familiarity   4.43
## 7 stress RTlexdec      6.30
## 8 stress RTnaming      6.14
## 9 stress Familiarity   5.6
## 10 pork  RTlexdec      6.42

```

1.8.7.2 Rows to columns

Let's use the same code above and change the code from long format, back to wide format. `Pivot_wider` allows you to go back to the original dataset. You will need to use `unnest` to get all rows in the correct place. Try without it to see the result.

```

english %>%
  select(Word, RTlexdec, RTnaming, Familiarity) %>%
  pivot_longer(cols = c(RTlexdec, RTnaming, Familiarity), ## you can also add index, i.e., 2:4
               names_to = "variable",
               values_to = "values") %>%
  pivot_wider(names_from = "variable",
              values_from = "values") %>%
  head(10)

```

```

## Warning: Values from `values` are not uniquely identified; output will contain
## list-cols.
## * Use `values_fn = list` to suppress this warning.
## * Use `values_fn = {summary_fun}` to summarise duplicates.
## * Use the following dplyr code to identify duplicates.
##   {data} |>
##   dplyr::summarise(n = dplyr::n(), .by = c(Word, variable)) |>
##   dplyr::filter(n > 1L)

## # A tibble: 10 x 4

```

```
##      Word    RTlexdec  RTnaming  Familiarity
##      <fct>   <list>    <list>    <list>
##  1 doe      <dbl [2]> <dbl [2]> <dbl [2]>
##  2 whore    <dbl [2]> <dbl [2]> <dbl [2]>
##  3 stress   <dbl [2]> <dbl [2]> <dbl [2]>
##  4 pork     <dbl [2]> <dbl [2]> <dbl [2]>
##  5 plug     <dbl [2]> <dbl [2]> <dbl [2]>
##  6 prop     <dbl [2]> <dbl [2]> <dbl [2]>
##  7 dawn     <dbl [2]> <dbl [2]> <dbl [2]>
##  8 dog      <dbl [2]> <dbl [2]> <dbl [2]>
##  9 arc      <dbl [2]> <dbl [2]> <dbl [2]>
## 10 skirt    <dbl [2]> <dbl [2]> <dbl [2]>
```

But wait, where are the results? They are added in lists. We need to use the function `unnest()` to obtain the full results.

```
english %>%
  select(Word, RTlexdec, RTnaming, Familiarity) %>%
  pivot_longer(cols = c(RTlexdec, RTnaming, Familiarity), ## you can also add index, i
               names_to = "variable",
               values_to = "values") %>%
  pivot_wider(names_from = "variable",
              values_from = "values") %>%
  unnest() %>%
  head(10)
```

```
## Warning: Values from `values` are not uniquely identified; output will contain
## list-cols.
```

```
## * Use `values_fn = list` to suppress this warning.
```

```
## * Use `values_fn = {summary_fun}` to summarise duplicates.
```

```
## * Use the following dplyr code to identify duplicates.
```

```
## {data} |>
```

```
## dplyr::summarise(n = dplyr::n(), .by = c(Word, variable)) |>
```

```
## dplyr::filter(n > 1L)
```

```
## Warning: `cols` is now required when using `unnest()`.
```

```
## i Please use `cols = c(RTlexdec, RTnaming, Familiarity)`.
```

```
## # A tibble: 10 x 4
```

```
##      Word    RTlexdec  RTnaming  Familiarity
##      <fct>    <dbl>    <dbl>    <dbl>
##  1 doe        6.54      6.15      2.37
##  2 doe        6.66      6.42      2.37
##  3 whore       6.40      6.25      4.43
##  4 whore       6.68      6.64      4.43
##  5 stress      6.30      6.14      5.6
##  6 stress      6.54      6.49      5.6
##  7 pork        6.42      6.13      3.87
```

```
## 8 pork      6.55    6.40    3.87
## 9 plug      6.45    6.20    3.93
## 10 plug     6.64    6.42    3.93
```

Ah that is better. But we get warnings. What does the warnings tell us? These are simple warnings and not errors. You can use the suggestions the **Tidyverse** makes. By default, we are told that the results are shown as lists of columns (what we are after). The second warning tells you to use a specific specification with `unnest()`.

1.8.8 Basic descriptive statistics

1.8.8.1 Basic summaries

We can use `summary()` to obtain basic summaries of the dataset. For numeric variables, this will give you the minimum, maximum, mean, median, 1st and 3rd quartiles; for factors/characters, this will be the count. If there are missing values, you will get number of NAs. Look at the summaries of the dataset below.

```
english %>%
  summary()
```

```
##      RTlexdec      RTnaming      Familiarity      Word      AgeSubject
## Min.   :6.205    Min.   :6.022    Min.   :1.100    arm    : 4    old :2284

1.8.8.2 Summary for a specific variable

```
english %>%
  summarise(count = n(),
            range_RTlexdec = range(RTlexdec),
            mean_RTlexdec = mean(RTlexdec),
            sd_RTlexdec = sd(RTlexdec),
            var_RTlexdec = var(RTlexdec),
            min_RTlexdec = min(RTlexdec),
            max_RTlexdec = max(RTlexdec),
            quart1_RTlexdec = quantile(RTlexdec, 0.25),
            quart1_RTlexdec = quantile(RTlexdec, 0.75),
            median_RTlexdec = median(RTlexdec))
```

```
## Warning: Returning more (or less) than 1 row per `summarise()` group was deprecated in
## dplyr 1.1.0.
## i Please use `reframe()` instead.
## i When switching from `summarise()` to `reframe()`, remember that `reframe()`
## always returns an ungrouped data frame and adjust accordingly.
## Call `lifecycle::last_lifecycle_warnings()` to see where this warning was
## generated.
```

```
##   count range_RTlexdec mean_RTlexdec sd_RTlexdec var_RTlexdec min_RTlexdec
## 1  4568      6.205325      6.550097  0.1569188  0.02462351      6.205325
## 2  4568      7.187808      6.550097  0.1569188  0.02462351      6.205325
##   max_RTlexdec quart1_RTlexdec median_RTlexdec
## 1      7.187808      6.653211      6.550466
## 2      7.187808      6.653211      6.550466
```

As you can see, we can add use `summarise` to obtain summaries of the dataset. We asked here for the mean, sd, variance, minimum and maximum values, etc.. In the dataset `english`, we have many numeric variables, and if we want to obtain summaries for all of numeric variables, we can use `summarise_all`.

1.8.8.3 Summarise_all

If you want to add another level of summaries, e.g., for length, you can either add them as another level (with a new variable name) or use `summarise_all` to do that for you. We need to select only numeric variables to do that. This is the function to only select numeric variables `where(is.numeric)`. If you do not use it, you will get an error message

```
english %>%
  select(where(is.numeric)) %>%
  summarise_all(funs(mean = mean, sd = sd, var = var, min = min, max = max,
```

```

range = range, median = median, Q1 = quantile(., probs = 0.25), Q3 = quantile(., probs = 0.75)

## Warning: `funs()` was deprecated in dplyr 0.8.0.
## i Please use a list of either functions or lambdas:
##
## # Simple named list: list(mean = mean, median = median)
##
## # Auto named with `tibble::lst()`: tibble::lst(mean, median)
##
## # Using lambdas list(~ mean(., trim = .2), ~ median(., na.rm = TRUE))
## Call `lifecycle::last_lifecycle_warnings()` to see where this warning was
## generated.

```

As you can see, in this example, we see the chains of commands in the **Tidyverse**. We can continue to add commands each time we want to investigate something in particular. Keep adding pipes and commands. The most important point is that the dataset **english** did not change at all. If you want to create a new dataset with the results, simply use the assignment function `<-` at the beginning or `->` at the end and give a name to the new dataset.

1.8.8.4 Group_by

1.8.8.5 One variable

What if you want to obtain all results summarised by a specific grouping? Let's obtain the results grouped by the levels of **AgeSubject**.

```
english %>%
  group_by(AgeSubject) %>%
  summarise(count = n(),
            range_RTlexdec = range(RTlexdec),
            mean_RTlexdec = mean(RTlexdec),
            sd_RTlexdec = sd(RTlexdec),
            var_RTlexdec = var(RTlexdec),
            min_RTlexdec = min(RTlexdec),
            max_RTlexdec = max(RTlexdec),
            quart1_RTlexdec = quantile(RTlexdec, 0.25),
            quart1_RTlexdec = quantile(RTlexdec, 0.75),
            median_RTlexdec = median(RTlexdec))

## Warning: Returning more (or less) than 1 row per `summarise()` group was deprecated in
## dplyr 1.1.0.
## i Please use `reframe()` instead.
## i When switching from `summarise()` to `reframe()`, remember that `reframe()`
##   always returns an ungrouped data frame and adjust accordingly.
## Call `lifecycle::last_lifecycle_warnings()` to see where this warning was
## generated.

## `summarise()` has grouped output by 'AgeSubject'. You can override using the
## `.groups` argument.

## # A tibble: 4 x 10
## # Groups:   AgeSubject [2]
##   AgeSubject count range_RTlexdec mean_RTlexdec sd_RTlexdec var_RTlexdec

```

1.8.8.6 Multiple variables

What if you want to obtain all results summarised by multiple groupings? Let's obtain the results grouped by the levels of `AgeSubject`, `WordCategory` and `Voice` and we want to save the output.

```
english %>%
  group_by(AgeSubject, WordCategory, Voice) %>%
  summarise(count = n(),
            range_RTlexdec = range(RTlexdec),
            mean_RTlexdec = mean(RTlexdec),
            sd_RTlexdec = sd(RTlexdec),
            var_RTlexdec = var(RTlexdec),
            min_RTlexdec = min(RTlexdec),
            max_RTlexdec = max(RTlexdec),
            quart1_RTlexdec = quantile(RTlexdec, 0.25),
            quart1_RTlexdec = quantile(RTlexdec, 0.75),
            median_RTlexdec = median(RTlexdec)) -> dfMeans
```

```
## Warning: Returning more (or less) than 1 row per `summarise()` group was deprecated
## dplyr 1.1.0.
## i Please use `reframe()` instead.
## i When switching from `summarise()` to `reframe()`, remember that `reframe()`
##   always returns an ungrouped data frame and adjust accordingly.
## Call `lifecycle::last_lifecycle_warnings()` to see where this warning was
## generated.

## `summarise()` has grouped output by 'AgeSubject', 'WordCategory', 'Voice'. You
## can override using the `.groups` argument.
```

```

```

1.8.9 Summary tables

1.8.9.1 Using summarytools

Using the package `summarytools` you can obtain nice table ready for publications!

```
english %>%
  dfSummary(graph.col = TRUE, style = "grid") %>%
  stview(method = "render")
```

1.8.9.1.1 Summary of full dataset with graphs

```
english %>%
  descr() %>%
  stview(method = "render")
```

1.8.9.1.2 Descriptive statistics for numeric variables

```
## Non-numerical variable(s) ignored: Word, AgeSubject, WordCategory, CV, Obstruent, Frication, V
```

```
english %>%
  freq() %>%
  stview(method = "render")
```

1.8.9.1.3 Frequencies for non-numeric variables

```
## Variable(s) ignored: RTlexdec, RTnaming, Familiarity, WrittenFrequency, WrittenSpokenFrequency
```

1.8.9.2 Using gtsummary

We use the `gtsummary` package to create nice tables for publication. This package is very useful for creating publication ready tables with descriptive statistics,

Characteristic	N = 4,568 ¹
AgeSubject	
old	2,284 (50%)
young	2,284 (50%)
RTlexdec	6.55 (6.43, 6.65)
Familiarity	3.70 (3.00, 4.57)
WordCategory	
N	2,904 (64%)
V	1,664 (36%)
Voice	
voiced	2,060 (45%)
voiceless	2,508 (55%)

¹n (%); Median (Q1, Q3)

regression models, etc. See this link for more details on the various options possible with this package.

```
english %>%
  tbl_summary(include = c(AgeSubject, RTlexdec, Familiarity, WordCategory, Voice))
```

1.8.9.2.1 Basic summaries

1.8.9.2.2 With statistics (comparing means) We use the two numeric outcomes and assess differences between the two groups.

```
english %>%
  tbl_summary(include = c(RTlexdec, RTnaming),
    by = AgeSubject, # split table by AgeSubject
    missing = "no" # don't list missing data separately
  ) %>%
  add_n() %>% # add column with total number of non-missing observations
  add_p() %>% # test for a difference between groups
  modify_header(label = "**Variable**") %>% # update the column header
  bold_labels()
```

1.8.10 Visualisation

In the *tidyverse*, the package for making elegant plots is called `ggplot2`. It works a lot like how pipes work, but since it was originally designed as a separate package, it uses `+` instead of `%>%`.

Variable	N	old N = 2,284 ¹	young N = 2,284 ¹	p-value ²
RTlexdec	4,568	6.64 (6.57, 6.73)	6.43 (6.36, 6.51)	<0.001
RTnaming	4,568	6.49 (6.45, 6.53)	6.15 (6.12, 6.18)	<0.001

¹Median (Q1, Q3)

²Wilcoxon rank sum test

1.8.10.1 First steps

1.8.10.1.1 Empty plot area Let's produce a basic plot with nothing drawn on it. This is the basic plotting area in R. We need to then add layers on top of it to show our plot

```
english %>%
  ggplot() +
  theme_bw()
```

1.8.10.1.2 Adding x and y values Let's add the x and y values from our dataset. X = subjective familiarity rating, y = RT in Visual Lexical Decision task

```
english %>%
  ggplot(aes(x = Familiarity,
             y = RTlexdec)) +
```

```
theme_bw()
```

There are no differences between the two. We need to tell `ggplot2` to add a geometric function for plotting

1.8.10.1.3 Adding geoms Geoms are integrated within `ggplot2` to obtain various types of plots.

```
english %>%
  ggplot(aes(x = Familiarity,
             y = RTlexdec)) +
  theme_bw() +
  geom_point()
```

1.8.10.1.4 Adding line of best fit We will add a line of best fit. This is used to evaluate presence/absence of a relationship between two numeric variables

```
english %>%  
  ggplot(aes(x = Familiarity,  
             y = RTlexdec)) +  
  theme_bw() +  
  geom_point() +  
  geom_smooth(method = "lm") ## line of best fit based on the lm() method
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

The result shows a nice negative correlation! RT lexical decision decreases when familiarity rating increases.

We can ask, are there differences related to the word category, i.e., verb vs noun?

1.8.10.15 By word category We change colour by levels of word category;

```
english %>%
  ggplot(aes(x = Familiarity,
             y = RTlexdec,
             colour = WordCategory)) + ## add colour to the base aesthetics
  theme_bw() +
  geom_point() +
  geom_smooth(method = "lm")
```

```
## `geom_smooth()` using formula = 'y ~ x'
```

1.8.10.1.6 Making final touches Let's add a title and a subtitle, change x and y labels, change size of overall plot, and colours of the categories.

```
english %>%
  ggplot(aes(x = Familiarity,
             y = RTlexdec,
             colour = WordCategory)) + ## add colour to the base aesthetics
  theme_bw() +
  geom_point() +
  geom_smooth(method = "lm") +
  labs(x = "Familiarity rating", y = "RT Lexical Decision", title = "Familiarity rating vs RT in")
  theme(text = element_text(size = 15)) + ## increase size of plot
  theme(legend.position = "bottom", legend.title = element_blank()) + ## remove legend title and
  scale_color_manual(labels = c("Nouns", "Verbs"), values = c("blue", "red")) ## change colours a

## `geom_smooth()` using formula = 'y ~ x'
```

Familiarity rating vs RT in a lexical decision task with a trend line

To choose colours, use the `addin colourpicker` from above. See this link for full list of colours available. Use colours that are colour-blind friendly here

1.8.10.2 Additional plots

We looked above at one example of plots (with points). We could use additional types of plots.

1.8.10.2.1 A bar plot Will show barplots of the dataset

```
english %>%
  ggplot(aes(x = RTlexdec,
             colour = AgeSubject)) +
  theme_bw() +
  geom_bar()
```

And another view with error bars! This is a nice example that shows how you can combine multiple chains with the pipe:

- Group by Age of subject
- Compute mean and SD
- use ggplot2 syntax to plot a barplot and error bars

```
english %>%
  group_by(AgeSubject) %>%
  summarise(
    sd = sd(RTlexdec),
    RTlexdecM = mean(RTlexdec)
  ) %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdecM)) +
  theme_bw() +
  geom_col(fill = "lightgray", color = "black") +
  geom_errorbar(aes(ymin = RTlexdecM-sd, ymax = RTlexdecM+sd), width = 0.2)
```

1.8.10.2.2 A histogram This looks at the distribution of the variable. We look at a histogram

```
english %>%
  ggplot(aes(x = RTlexdec,
             colour = AgeSubject)) +
  theme_bw() +
  geom_histogram(fill = "white") +
  scale_color_manual(values = c("red", "blue"))
```

```
## `stat_bin()` using `bins = 30`. Pick better value `binwidth`.
```

1.8.10.2.3 A density plot This looks at the distribution of the variable. We see that the two variables have different means. We can superpose the density plot on top of the histogram or have the density plot on its own.

```
english %>%
  ggplot(aes(x = RTlexdec,
             colour = AgeSubject)) +
  theme_bw() +
  geom_histogram(aes(y = ..density..), fill = "white") +
  scale_color_manual(values = c("red", "blue")) +
  geom_density()
```

1.8.10.2.3.1 Histogram and density plot

```
## Warning: The dot-dot notation (`..density..`) was deprecated in ggplot2 3.4.0.
## i Please use `after_stat(density)` instead.
## This warning is displayed once every 8 hours.
## Call `lifecycle::last_lifecycle_warnings()` to see where this warning was
## generated.

## `stat_bin()` using `bins = 30`. Pick better value `binwidth`.
```

```
english %>%  
  ggplot(aes(x = RTlexdec,  
             colour = AgeSubject)) +  
  theme_bw() +  
  geom_density()
```

1.8.10.2.3.2 Density plot only

1.8.10.2.4 A boxplot This allows you to see various information, including the Median, SD, Quartiles (25% and 75%) and outliers. Looking at the medians, we see clear difference between the two distributions.

```
english %>%  
  ggplot(aes(x = AgeSubject,  
             y = RTlexdec)) +  
  theme_bw() +  
  geom_boxplot()
```

1.8.10.2.5 A Violin plot This allows you to see various information, including the Median, SD, Quartiles (25% and 75%) and outliers. Looking at the medians, we see clear difference between the two distributions.

```
english %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdec)) +
  theme_bw() +
  geom_violin()
```

1.8.10.3 Advanced plots

We will use the package `ggdist` see herewhich allows us to obtain various plots adding the distributions.

1.8.10.3.1 A dotplot This dotplot allow to display the distribution of the dataframe showing their density

```
english %>%  
  ggplot(aes(x = AgeSubject,  
             y = RTlexdec)) +  
  theme_bw() +  
  stat_dotsinterval()
```

1.8.10.3.2 Rain cloud plots Rain clouds are used to combine both a density plot with dotplots in the same figure. These can be informative as to the overall distribution of the dataset.

```
english %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdec,
             fill = AgeSubject)) +
  theme_bw() +
  stat_slab(aes(thickness = after_stat(pdf*n)), scale = 0.7) +
  stat_dotsinterval(side = "bottom", scale = 0.7, slab_linewidth = NA) +
  scale_fill_brewer(palette = "Set2")
```

1.8.10.3.3 Eye plots and half-eye plots We can also obtain density plots with eye plots and half-eye plots. These are similar to rain clouds but allow you to see the distribution of the data in a different way. For these plots, using `stat_slabinterval()` with `side = "both", "top", "bottom", "right",` or `"left"` you can adjust positions of the eye plots. Note that with `"top",` or `"bottom",` the y value is a categorical predictor and the x is a numeric outcome.

1.8.10.3.3.1 Eye plot We can use `stat_eye()` or `stat_slabinterval(side = "both")` to obtain eye plots.

```
english %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdec,
             fill = AgeSubject)) +
  theme_bw() +
  stat_eye()
```

```
english %>%  
  ggplot(aes(x = AgeSubject,  
             y = RTlexdec,  
             fill = AgeSubject)) +  
  theme_bw() +  
  stat_slabinterval(side = "both")
```

1.8.10.3.3.2 Half-eye plot We can use `stat_halfeye()` or `stat_slabinterval()` to obtain half-eye plots. Use `stat_slabinterval(side = "left")` or `stat_slabinterval(side = "right")` to obtain half-eye plots on the left or right side of the plot, respectively.

```
english %>%  
  ggplot(aes(x = AgeSubject,  
             y = RTlexdec,  
             fill = AgeSubject)) +  
  theme_bw() +  
  stat_halfeye()
```

```
english %>%  
  ggplot(aes(x = AgeSubject,  
             y = RTlexdec,  
             fill = AgeSubject)) +  
  theme_bw() +  
  stat_slabinterval()
```

1.8.10.4 Facet_grid

The plots we used so far allowed to plot data as a function of one categorical variable, e.g., `AgeSubject`. What if we wanted to show the different patterns emerging when combining `AgeSubject` (old vs young), `WordCategory` (Noun or Verb), `CV` (Consonant or Vowel) and `Voice` (Voiced and Voiceless)? What if we also wanted to modify the labels and order of levels of variables?

We will start slowly below to show how we can combine two categorical variables and extend them to additional ones

1.8.10.4.1 Two categorical variables

1.8.10.4.1.1 First steps Here we obtain a boxplot with two categorical variables `AgeSubject` and `WordCategory`

```
english %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdec)) +
  theme_bw() +
  geom_boxplot() +
  facet_grid(~ WordCategory)
```

1.8.10.4.1.2 Changing order of levels within a variable and its labels

What would you do to change both order of levels within a variable and its labels? We want to change order for `AgeSubject` to be Young vs Old (rather than old vs young) and change labels of `WordCategory` from N vs V to Noun vs Verb?

```
english %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old"), labels = c("Young", "Old")),
         WordCategory = factor(WordCategory, labels = c("Noun", "Verb"))) %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdec)) +
  theme_bw() +
  geom_boxplot() +
  facet_grid(~ WordCategory)
```

1.8.10.4.2 Three or more categorical variables Let us obtain a boxplot with four categorical variables `AgeSubject`, `WordCategory`, `CV` and `Voice`. We still need to change names. We can also add `margins = TRUE` to obtain mean values for all categories (under `all`). We can also use `scale = "free"` to change limits of the y-axis.

Of course this figure is so complex that it needs a lot of interpretation. But it allows you to see how we can use `facet_grid` to get more categorical variables in. This visualisation suggests that there are no clear differences when plotting results by this 4-way interaction as we always have clear differences between “Young” and “Old” participants, with “Young” being faster than “Old” participants.

```
english %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old"), labels = c("Young", "Old")),
         WordCategory = factor(WordCategory, labels = c("Noun", "Verb")),
         CV = factor(CV, labels = c("Consonant", "Vowel"))) %>%
  ggplot(aes(x = AgeSubject,
             y = RTlexdec)) +
  theme_bw() +
  geom_boxplot() +
  facet_grid(CV + Voice ~ WordCategory, margins = TRUE, scales = "free")
```

1.8.10.4.3 Comparing two numeric outcomes What if we want to compare performance in relation to reaction time for the lexical decision task (RTlexdec) and reaction time for naming (RTnaming). We want to see if there are differences related to the AgeSubject, WordCategory. We use `pivot_longer` here to do change the format of our table and then change names and use `facet_grid`.

```
english %>%
  select(RTlexdec, RTnaming, AgeSubject, WordCategory) %>%
  pivot_longer(cols = c(RTlexdec, RTnaming),
               names_to = "variable",
               values_to = "values") %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old"), labels = c("Young", "Old")),
         WordCategory = factor(WordCategory, labels = c("Noun", "Verb"))) %>%
  ggplot(aes(x = variable,
             y = values)) +
  theme_bw() +
  geom_boxplot() +
  facet_grid(AgeSubject ~ WordCategory, margins = TRUE, scales = "free")
```

1.8.10.4.4 Exporting images When you use Rmarkdown, your figures are already embedded within the generated output. If you are using an R script and/or want to add the figure in a different document, you can use the following code:

```
jpeg(filename = paste0("outputs/test.jpeg"), width = 15, height = 15, units = "cm", res = 300)

english %>%
  select(RTlexdec, RTnaming, AgeSubject, WordCategory) %>%
  pivot_longer(cols = c(RTlexdec, RTnaming),
               names_to = "variable",
               values_to = "values") %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old"), labels = c("Young", "Old")),
         WordCategory = factor(WordCategory, labels = c("Noun", "Verb"))) %>%
  ggplot(aes(x = variable,
             y = values)) +
  theme_bw() +
  geom_boxplot() +
  facet_grid(AgeSubject ~ WordCategory, margins = TRUE, scales = "free")
dev.off()

## pdf
## 2
```

The image is automatically saved into your working directory and you can import it to your word (L^AT_EX) document.

You can use any device to save the output. Jpeg, PNG, PDF, TIFF, etc.. From an R script, you can run the code and then the image will appear within the “Plots” area. Simply click on export and you will be able to save the image.

1.8.10.5 Conclusion

As you can see, visualisations in R using the **Tidyverse** provide you with many options and you can explore these further.

See [here](#) for a full list of geoms. This will help you in thinking about visualisation.

See extensions to `ggplot2` [here](#) for additional plugins to enhance plots.

1.9 PhonR

1.9.1 Intro

These two packages allow to do various things with phoneticity data. **PhonR** former allows to normalise data and generate nice plots; the **Vowels** is a suite of normalisation procedures and plotting functions (it used to be an online platform, but this is not working anymore! see [here](#) or [here](#)). See help for **Vowels**.

We’ll heavily use **PhonR** as it provides standard and many advanced options for normalisation and plotting, etc..

I am borrowing many examples from the **PhonR** link. You can adapt the codes below to your own data

```
data(indoVowels) # provides dataframe 'indo'
str(indo)

## 'data.frame':    1725 obs. of  5 variables:
## $ subj   : chr  "F02" "F02" "F02" "F02" ...
## $ gender: Factor w/ 2 levels "f","m": 1 1 1 1 1 1 1 1 1 1 ...
## $ vowel  : Factor w/ 5 levels "a","e","i","o",...: 1 1 1 1 1 1 1 1 1 1 ...
## $ f1     : int   1052 904 606 652 1129 968 1124 924 602 607 ...
## $ f2     : int   1800 1911 1829 1901 1863 1699 1882 1876 1815 1950 ...
```

1.9.2 Normalisation

```

Part II

Statistical analyses using R

Chapter 2

Correlation, LM, GLM, STD and CLM

This chapter introduces you to the basics of inferential statistics. We cover correlation tests to identify specific patterns in the data. We then use linear models to evaluate group differences, and generalised linear models to evaluate binary outcomes. We also introduce the basics of signal detection theory (SDT) to evaluate the accuracy of our models. At the end of this chapter, we introduce the basics of cumulative link models (CLM) to evaluate ordinal (likert) outcomes on two datasets.

2.1 Loading packages

```
## Use the code below to check if you have all required packages installed. If some are not installed
requiredPackages = c('tidyverse', 'broom', 'knitr', 'Hmisc', 'corrplot', 'emmeans', 'ggsignif', '')
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p)
  library(p,character.only = TRUE)
}
```

2.2 Inferential statistics

2.2.1 Introduction

What do we mean by inferential statistics?

We want to evaluate if there are differences observed between two groups of datapoints and if these differences are statistically significant.

For this, we need to pay attention to the format of our outcome and predictors. An outcome is the response variable (or dependent variable); a predictor is our independent variable(s). This is fed into our equation

$$y = x\beta + \varepsilon$$

where:

- $y \rightarrow$ outcome (DV) $\Rightarrow$ known
- $x \rightarrow$ fixed effect (IV) $\Rightarrow$ known
- $\beta \rightarrow$ coefficient of fixed effect $\Rightarrow$ unknown
- $\varepsilon \rightarrow$ random error term $\Rightarrow$ unknown

2.2.2 Hypothesis testing

In the approach that this book follows, we use a frequentist approach to hypothesis testing. By frequentist we mean when modelling the relationship between an outcome and a predictor, we are interested in testing if the predictor has a clear and statistically significant influence on the outcome. When evaluating this, we try to reject the null hypothesis (H_0) in favour of the alternative hypothesis (H_1).

The null hypothesis (H_0) is the hypothesis we make that there is no statistical evidence in favour of an effect nor of a difference between the groups. The alternative hypothesis (H_1) is the hypothesis we make to reject the null hypothesis and there is indeed a statistical evidence in favour of an effect or a difference between the groups.

2.2.3 Type of outcomes

It is important to know the class of the outcome before doing any pre-data analyses or inferential statistics. Outcome classes can be one of:

1. **Numeric**: As an example, we have length/width of leaf; height of mountain; fundamental frequency of the voice; etc. These are generally modelled with a **Gaussian** distribution. These are **true** numbers and we can use summaries, t-tests, linear models, etc. Integers are a family of numeric variables and can still be considered as a normal numeric variable. Count data are numbers related to a category. In general, these are related to the second type of outcomes, and should be analysed using a poisson logistic regression.
2. **Categorical (Unordered)**: Observations for two or more categories. As an example, we can have gender of a speaker (male or female); responses to a True vs False perception tests; Colour (unordered) categorisation, e.g., red, blue, yellow, orange, etc.. For these we can use a Generalised Linear Model (binomial or multinomial) or a simple chi-square test.

3. **Categorical (Ordered)**: When you run a rating experiment, where the outcome is either **numeric** (i.e., 1, 2, 3, 4, 5) or **categories** (i.e., disagree, neutral, agree). The **numeric** option is NOT a true number as for the participant, these are categories. Cumulative Logit models (or Generalised Linear Model with a cumulative function) are used. The mean is meaningless here, and the median is a preferred descriptive statistic.

2.2.4 Types of Errors?

In the literature, we discuss various types of errors in statistical models. There are four different types, and the excellent Sonderegger (2023) book (Sonderegger, M. (2023). *Regression Modeling for Linguistic Data*. The MIT Press.) summarises these nicely. Here are the four types:

1. **Type I** (or “false positive” or error α) $\Rightarrow$ falsely concluding there is an effect when none exists. (generally due to inaccurate modelling strategies)
2. **Type II** (or “false negative” or error β) $\Rightarrow$ falsely concluding there is no effect when one in fact exists (generally due to inaccurate modelling strategies)

		Statistical analysis result (sample)	
		Reject H_0	Don't reject H_0
Reality (population)	H_0 is true H_0 is false	Type I error (α) Correct decision (significant)	Correct decision (null result) Type II error (β)

3. **Type S** $\Rightarrow$ Inaccurate sign (generally due to *hidden* multicollinearity and low power = $1 - \beta$)
4. **Type M** $\Rightarrow$ Inaccurate magnitude (generally due to *hidden* multicollinearity and low power = $1 - \beta$)

It is important to note that the **Type I** and **Type II** errors are the most commonly discussed in the literature and are related to each other. Modelling is an art, and depending on model specifications, we can easily increase **Type I** and/or **Type II** errors. **Type I** is usually increased in the case of using inaccurately specified model, e.g., not using a random effects structure when the data comes from multiple speakers and/or multiple items. **Type II** error is usually increased when there is an over specification of the model and/or not accounting for dependencies in the data. **Type S** and **Type M** are generally caused due to collinearity in the data, which causes instability in the model and leads to cases of suppression; a point discussed in **chapter 8**.

2.3 Effect size and power analysis

2.3.1 Effect size

2.3.1.1 What is the purpose of Effect Size?

‘Effect size’ is simply a way of quantifying the size of the difference between two groups.

There are two family groups of Effect Size:

1. Standardised mean differences (also called group difference indices; e.g., Cohen’s d), The mean difference Effect Sizes are computed when the focus of the statistical analysis uses mean outcome scores to compare potential group differences.
2. Strength of association (also referred to as relationship variance-accounted-for or variance explained Effect Sizes; e.g., R^2 , η^2 , η^2p , ω^2 , etc. Strength of association Effect Size indices are calculated across a wide variety of research designs (e.g., ex post facto or causal comparative, experimental, quasi-experimental, prediction [regression and correlational]) using the general linear model (GLM) for the statistical analyses. Strength of association Effect Sizes indicate how much of the variance associated with the dependent variable (e.g., students’ English test scores) can be accounted for (or explained) by the independent variable(s) (e.g., gender).

Both Effect Size families can be further categorised into biased (uncorrected) and unbiased (corrected) measures:

- Biased measures relates to “**sampling error**” and how the Effect Size derived from statistical procedures computed with smaller groups of participants (samples) drawn from a larger population will be higher than would be found either in the original population or in participant samples studied at a later date.

For example, assume a school counselling researcher randomly selects a sample of 15 girls and 15 boys from a 10th-grade physical education class in one high school. This 30-person sample then is assumed to represent the entire population of male and female students attending all Grade 10 physical education classes across a district’s five high schools. Because there is always sampling error (i.e., problems with selecting the students to participate in the research study), uncorrected Effect Sizes (e.g., Cohen’s d , R^2 , η^2) will be higher (i.e., positively biased or overestimated) for the 30 students than if the researcher actually could have included in the study every 10th-grade physical education student across all five high schools.

- Unbiased ones (e.g., adjusted R^2 , Hays’ ω^2 , etc.) statistically correct for this positive bias by calculating the strength of association indices so that they better reflect the true Effect Sizes for the entire population and those calculated in future samples.

The issue is that because these formulas must adjust for sampling error occurring both in the present study and in subsequent investigations, Effect Size estimates for future research samples result in more shrinkage (i.e., are smaller or more conservative) than those Effect Size estimates based on an entire population. Therefore, interpretation of Effect Size s is often less than straightforward and must be exercised with caution.

2.3.1.2 What is the relationship between Effect Size and Significance?

Effect size quantifies the size of the difference between two groups, and may therefore be said to be a true measure of the significance of the difference.

The statistical significance is usually calculated as a ‘p-value’, the probability that a difference of at least the same size would have arisen by chance, even if there really were no difference between the two populations. For differences between the means of two groups, this p-value would normally be calculated from a ‘t-test’. By convention, if $p < 0.05$ (i.e. below 5%), the difference is taken to be large enough to be ‘significant’; if not, then it is ‘not significant’.

There are a number of problems with using ‘significance tests’ in this way. The main one is that the p-value depends essentially on two things:

- a) The size of the effect
- b) The size of the sample.

One would get a ‘significant’ result either if the effect were very big (despite having only a small sample) or if the sample were very big (even if the actual effect size were tiny). It is important to know the statistical significance of a result, since without it there is a danger of drawing firm conclusions from studies where the sample is too small to justify such confidence. However, statistical significance does not tell you the most important thing: **the size of the effect**. One way to overcome this confusion is to report the effect size, together with an estimate of its likely ‘margin for error’ or ‘confidence interval’.

2.3.1.3 What is Confidence Interval?

The confidence interval is an alternative way to indicate the variability in estimates from small samples. The default calculation here is a ‘95% confidence interval’. If multiple samples of two groups of the same size as these, taken from a population in which the true difference was the value in column J, there would be variation in the differences found. However, for every 100 samples taken, for 95 of them (on average) the difference would be between the lower and upper confidence limits. The confidence interval is usually interpreted as a ‘margin of uncertainty’ around the estimate of the difference between experimental and control groups.

2.3.1.4 Which Effect Size measure to use?

We highlighted above various effect size measures, e.g., Cohen's d , R^2 , η^2 , η^2p , ω^2 . Which one to chose from? Well, all depends on the statistical approach you are using and whether you want to report on standardised or unstandardised measures.

However, as a rule of thumb, you can do the following:

1. In general, if we want to talk about the sample we have, we can use any biased method (like the eta-squared) because it estimates only for the sample and not the population.
2. If we want to generalise our results, we have to use an unbiased method.

Literature recommends using an Effect Size measure accompanied with the Confidence Interval, because telling only that a result is statistically significant doesn't inform us of the contribution of the independent variable to explain the variation in the dependent variable.

2.3.1.5 How to compute these in R

We use the package `effectsize`

2.3.1.5.1 Standardised effect sizes (Cohen's d) It can be computed using the following formula:

$$d = \frac{Mean_{factor1} - Mean_{factor2}}{SD_{pooled}}$$

With the pooled standard deviation computed as:

$$SD_{pooled} = \sqrt{\frac{SD_{factor1}^2 * (Number_{factor1} - 1) + SD_{factor2}^2 * (Number_{factor2} - 1)}{Number_{factor1} + Number_{factor2} - 2}}$$

Fortunately, instead of calculating it manually, we can use the function `cohens_d()` from the package `effectsize`.

```
options(es.use_symbols = TRUE) # get nice symbols when printing! (On Windows, requires
english %>%
  lm(RTlexdec ~ AgeSubject, data = .) %>%
  summary()
```

2.3.1.5.1.1 Linear model

```
##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Residuals:
```

```
##      Min      1Q   Median      3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)    6.660958   0.002324 2866.44  <2e-16 ***
## AgeSubjectyoung -0.221721   0.003286  -67.47  <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF,  p-value: < 2.2e-16
```

What the model above tells us is that there is a very highly statistically significant impact of AgeSubject on RTlexdec ($p < 0.0001$).

2.3.1.5.1.2 Cohen's d However, it does not tell us how large this effect is. That is where we can use the `cohens_d()` function.

```
# Cohen's d
english %>%
  cohens_d(RTlexdec ~ AgeSubject, data = .) %>%
  interpret_cohens_d()
```

```
## Cohen's d |          95% CI | Interpretation
## -----
## 2.00      | [1.93, 2.07] |          large
##
## - Estimated using pooled SD.
## - Interpretation rule: cohen1988
```

One nice option in the package `effectsize` is to use an *Automated Interpretation of Indices of Effect Size* vignette. We can use the original publication to interpret the effect size or use an alternative. See the link above for more details.

We can also standardise our model's coefficients, which allows us to compare the effect sizes of different predictors in the same model and between models, variables and studies.

```
model <- english %>%
  lm(RTlexdec ~ AgeSubject, data = .)

datawizard::standardize(model)
```

2.3.1.5.1.3 Standardised coefficients

```
##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = data_std)
##
## Coefficients:
##      (Intercept)  AgeSubjectyoung
##           0.7065          -1.4130
parameters::standardize_parameters(model)
```

```
## # Standardization method: refit
##
## Parameter          | Std. Coef. |          95% CI
## -----
## (Intercept)        |      0.71 | [ 0.68,  0.74]
## AgeSubject [young] |     -1.41 | [-1.45, -1.37]
```

Standardised coefficients are interpreted as the change in standard deviations of the outcome variable for a one standard deviation change in the predictor variable. We can initially standardise our outcomes using the function `scale(center = TRUE, scale = TRUE)` and then run our model, OR use the function `standardize()` from the package `datawizard` or `standardize_parameters()` from the package `parameters` to do that.

2.3.1.5.2 Strength of association effect sizes Here, we saw already that there are biased and unbiased measures. We will document the classical measures used.

2.3.1.5.2.1 R^2 R^2 (R squared): It is the proportion of variance explained by the model. This is a biased effect size measure. It is computed as:

$$R^2 = \frac{SS_{model}}{SS_{total}} = 1 - \frac{SS_{residual}}{SS_{total}}$$

Where:

- SS_{model} is the sum of squares of the model
- SS_{total} is the total sum of squares
- $SS_{residual}$ is the sum of squares of the residuals.

We can get the R^2 and the adjusted R^2 from the summary of the model:

```
summary(model)$r.squared

## [1] 0.49923
summary(model)$adj.r.squared

## [1] 0.4991203
```

2.3.1.5.2.2 η^2 (eta squared) The eta-squared effect size measure is a biased measure and describes the ratio of variance explained in the dependent variable by a predictor (or factor) while controlling for other predictors (or in a simple way: it is the proportion of total variation attributable to the factor). The range is from 0 to 1 and it sums up to 1. Eta squared is a biased estimator of the variance explained by the model in the population (it only estimates effect size in the sample). On average it overestimates the variance explained in the population. . It is computed as:

$$\eta^2 = \frac{SS_{model}}{SS_{total}}$$

- SS_{model} is the sum of squares of the model
- SS_{total} is the total sum of squares
- $SS_{residual}$ is the sum of squares of the residuals.

In a sense, both R^2 and η^2 are computed in the same way.

To obtain it directly from the model, we can use the function `eta_squared()` from the package `effectsize` and specify `partial = FALSE`.

```
# eta squared
english %>%
  aov(RTlexdec ~ AgeSubject, data = .) %>%
  eta_squared(., partial = FALSE) %>%
  interpret_eta_squared()

## # Effect Size for ANOVA (Type I)
##
## Parameter |      ^2 |      95% CI | Interpretation
## -----
## AgeSubject | 0.50 | [0.48, 1.00] | large
##
## - One-sided CIs: upper bound fixed at [1.00].
## - Interpretation rule: field2013
```

2.3.1.5.2.3 η^2p (partial eta squared) η^2p (partial eta squared): “proportion of total variation attributable to the factor, partialling out (excluding) other factors from the total non error variation”. Partial eta squared is normally higher than eta squared (except in simple one-factor models). The range is from 0 to 1, and it sums up to more than 1 (except in one-way ANOVA). It is computed as:

$$\eta^2p = \frac{SS_{factor}}{SS_{factor} + SS_{error}}$$

Where:

- SS_{factor} is the sum of squares of the factor
- SS_{error} is the sum of squares of the error.

To obtain it directly from the model, we can use the function `eta_squared()` from the package `effectsize` and specify `partial = TRUE`.

```
# partial eta squared
english %>%
  aov(RTlexdec ~ AgeSubject, data = .) %>%
  eta_squared(., partial = TRUE) %>%
  interpret_eta_squared()

## For one-way between subjects designs, partial eta squared is equivalent
## to eta squared. Returning eta squared.

## # Effect Size for ANOVA
##
## Parameter |      ^2 |      95% CI | Interpretation
## -----
## AgeSubject | 0.50 | [0.48, 1.00] | large
##
## - One-sided CIs: upper bound fixed at [1.00].
## - Interpretation rule: field2013
```

2.3.1.5.2.4 ω^2 (omega squared) ω^2 (omega squared): Provides a relatively unbiased estimate of the variance explained in the population by a predictor variable. It takes random error into account more so than eta squared, which is incredibly biased to be too large. The range is from 0 to 1 and it sums up to 1.

It is computed as:

$$\omega^2 = \frac{SS_{model} - (df_{model} * MS_{error})}{SS_{total} + MS_{error}}$$

Where:

- SS_{model} is the sum of squares of the model
- SS_{total} is the total sum of squares
- df_{model} is the degrees of freedom of the model
- MS_{error} is the mean square of the error.

To obtain it directly from the model, we can use the function `omega_squared()` from the package `effectsize` and specify `partial = FALSE`.

```
# omega squared
english %>%
  aov(RTlexdec ~ AgeSubject, data = .) %>%
  omega_squared(., partial = FALSE) %>%
  interpret_omega_squared()
```

```
## # Effect Size for ANOVA (Type I)
##
```

```
## Parameter |      ^2 |      95% CI | Interpretation
## -----
## AgeSubject | 0.50 | [0.48, 1.00] |      large
##
## - One-sided CIs: upper bound fixed at [1.00].
## - Interpretation rule: field2013
```

2.3.1.5.2.5 Partial ω^2 (partial omega squared) Partial ω^2 (omega squared): “proportion of total variation attributable to the factor, partialling out (excluding) other factors from the total non error variation”. The range is from 0 to 1 and it sums up to more than 1 (except in one-way ANOVA). It is the equivalent of partial eta-squared but as an unbiased measure. It is computed as:

$$\omega^2 p = \frac{df_{factor} * MS_{factor} - MS_{error}}{df_{factor} * MS_{factor} + df_{total} - df_{factor} * MS_{error}}$$

Where:

- df_{factor} is the degrees of freedom of the factor
- MS_{factor} is the mean square of the factor
- df_{total} is the total degrees of freedom
- MS_{error} is the mean square of the error.

To obtain it directly from the model, we can use the function `omega_squared()` from the package `effectsize` and specify `partial = TRUE`.

```
# omega squared partial
english %>%
  aov(RTlexdec ~ AgeSubject, data = .) %>%
  omega_squared(., partial = TRUE) %>%
  interpret_omega_squared()
```

```
## For one-way between subjects designs, partial omega squared is
## equivalent to omega squared. Returning omega squared.
```

```
## # Effect Size for ANOVA
##
## Parameter |      ^2 |      95% CI | Interpretation
## -----
## AgeSubject | 0.50 | [0.48, 1.00] |      large
##
## - One-sided CIs: upper bound fixed at [1.00].
## - Interpretation rule: field2013
```

2.3.1.5.2.6 Odds ratio We will see in the [sections 2.6 and 3.4](#) that we use odds ratio as an exponentiation of the logodds (logit) coefficients. Odds ratios can be interpreted as the odds for an event to occur. In comparison to

the logodds (logit) scale, which spans -6 and 6 (well $-\infty - \infty$), odds ratio are very (very high) and can reach 999 for a logodds of 6.9. Of course, in some cases, odds ratio are not easy to interpret, and it is often “easier” to transform the logodds into proportions. See this excellent link where you can understand the links better.

2.3.2 Power analysis and sample size

Usually, when we design an experiment, we always ask the question: what is the optimal sample size to use so that I have confidence in the results I will obtain? To answer this question, we usually say: well it all depends on your discipline and what is feasible for a particular study. However, this can easily lead to misconceptions and issues in designing our studies and more importantly, in the interpretation of the results!

Hence, we demonstrate in the following power analysis and the sample size. These two are crucial as they are interlinked. We saw in **section 2.2.4** that there are four types of errors, with **Type M** and **Type S** depending heavily on the power and on the sample size.

We use the package **pwr**, which allows us to compute both power and sample size (but not at the same time!!). Looking at the vignette of the **pwr** package, they cite the various functions available, such as:

- **pwr.p.test**: one-sample proportion test
- **pwr.2p.test**: two-sample proportion test
- **pwr.2p2n.test**: two-sample proportion test (unequal sample sizes)
- **pwr.t.test**: two-sample, one-sample and paired t-tests
- **pwr.t2n.test**: two-sample t-tests (unequal sample sizes)
- **pwr.anova.test**: one-way balanced ANOVA
- **pwr.r.test**: correlation test
- **pwr.chisq.test**: chi-squared test (goodness of fit and association)
- **pwr.f2.test**: test for the general linear model

2.3.2.1 Cohen’s *d* interpretation rules and t.test

Based on J. Cohen (1988) rule of thumb, we can interpret Cohen’s *d* effect size measure as:

- $d < 0.2$ - Very small
- $0.2 \leq d < 0.5$ - Small
- $0.5 \leq d < 0.8$ - Medium
- $d \geq 0.8$ - Large

We can use the function **pwr.t.test()** to compute the power of a t.test.

2.3.2.1.1 pwr.t.test - one-sample and two-sample t tests for means

Based on the example below, we know that the variance between the two age groups with respect to RTlexdec is significantly different; meaning that there is no equality of variance in this case. This is important to know to be able to compute the t.test appropriately.

Here are the results of the t.test between the two groups:

```
english %>%
  t.test(RTlexdec ~ AgeSubject, data = ., var.equal = FALSE)

##
## Welch Two Sample t-test
##
## data: RTlexdec by AgeSubject
## t = 67.468, df = 4534.6, p-value < 2.2e-16
## alternative hypothesis: true difference in means between group old and group young is not equal to 0
## 95 percent confidence interval:
##  0.2152787 0.2281642
## sample estimates:
## mean in group old mean in group young
##           6.660958           6.439237
```

```
english %>%
  cohens_d(RTlexdec ~ AgeSubject, data = .) %>%
  interpret_cohens_d()
```

2.3.2.1.2 Cohen's *d* effect size

```
## Cohen's d |          95% CI | Interpretation
## -----|-----|-----
## 2.00      | [1.93, 2.07] |          large
##
## - Estimated using pooled SD.
## - Interpretation rule: cohen1988
cohen.ES(test = "t", size = "large")

##
## Conventional effect size from Cohen (1982)
##
## test = t
## size = large
## effect.size = 0.8
pwr.t.test(n = 2284, d = 2, sig.level = 2.2e-16)

##
```

```
##      Two-sample t test power calculation
##
##              n = 2284
##              d = 2
##      sig.level = 2.2e-16
##              power = 1
##      alternative = two.sided
##
## NOTE: n is number in each group
```

The results here show that with a sample size of 2284, a large effect size of 2 and a significance level of 2.2e-16, we have a power of 1 (or 100%). This is a massive power and effect size, but we know that the results are inflated due to not using a mixed effects model.

Now, let's imagine we use another sample.

We're interested to know if there is a difference in the mean reaction time in a lexical decision task between young and old participants. Let's say we randomly ask 30 young and 30 old participants to perform the test and calculate the mean reaction time for each group. We'll test for a difference in means using a two-sample t-test.

How powerful is this experiment if we want to detect a "medium" effect in either direction with a significance level of 0.001?

Unfortunately, we don't have any idea what the number of participants in the **english** dataset. It is composed of 2284 monomorphemic English nouns and verbs that are averaged across old and young subjects.

```
cohen.ES(test = "t", size = "large")

##
##      Conventional effect size from Cohen (1982)
##
##              test = t
##              size = large
##      effect.size = 0.8
pwr.t.test(n = 30, d = 0.8, sig.level = 0.01)

##
##      Two-sample t test power calculation
##
##              n = 30
##              d = 0.8
##      sig.level = 0.01
##      power = 0.6677563
##      alternative = two.sided
```

```
##
```

```
## NOTE: n is number in *each* group
```

The power is only at 66.78%! Not very powerful. How many students should we observe for a test with 80% power?

```
pwr.t.test(d = 0.8, power = 0.80, sig.level = 0.01)
```

```
##
```

```
##      Two-sample t test power calculation
```

```
##
```

```
##              n = 38.18831
```

```
##              d = 0.8
```

```
##      sig.level = 0.01
```

```
##      power = 0.8
```

```
##      alternative = two.sided
```

```
##
```

```
## NOTE: n is number in *each* group
```

We need at least 38 students per group. If we lower our p value, the sample size will increase drastically

2.3.2.1.3 Plots The `pwr` package comes with a handy plotting function that we can use to evaluate the impact of the increase in power, effect size and sample size for a specific p value

2.3.2.1.3.1 $p < 0.05$ What if we use a specific p value < 0.05 and a power of 0.80? How does the change in effect size impact the sample size? We simulate variable effect size measures at 0.2, 0.5, 0.8 and 2 based on the interpretation above.

Based on J. Cohen (1988) rule of thumb, we can interpret Cohen's d effect size measure as:

- $d < 0.2$ - Very small
- $0.2 \leq d < 0.5$ - Small
- $0.5 \leq d < 0.8$ - Medium
- $d \geq 0.8$ - Large

```
p.out <- pwr.t.test(d = 0.2, power = 0.80, sig.level = 0.05)
```

```

```

The plot above show the sample size required for the specific power, p value and effect size. Play around with these values to have an idea of the impact of these parameters on the sample size.

2.3.2.2 Linear model

2.3.2.2.1 General example We borrow from the vignette of the `pwr` package an example of a linear model.

2.3.2.2.1.1 Power of the test We want to compute the power we have with a sample size of 40 words, an effect size of 0.3 and a significance level of 0.001.

```
pwr.f2.test(u = 1, v = 40 - 1 - 1, f2 = 0.3/(1 - 0.3), sig.level = 0.001)
```

```
##
##      Multiple regression power calculation
##
##          u = 1
##          v = 38
##          f2 = 0.4285714
##      sig.level = 0.001
##          power = 0.7104043
```

Where:

- u = number of predictors

- v = degrees of freedom of the residuals ($n - u - 1$)
- $f2$ = effect size (Cohen's $f2$)
- sig.level = significance level (α)

2.3.2.2.1.2 Sample size We want to compute the sample size needed to have a power of 0.8, with a significance level of 0.001 and an effect size of 0.3 (medium effect size according to Cohen's conventions).

```
pwr.f2.test(u = 1, f2 = 0.3/(1 - 0.3), sig.level = 0.001, power = 0.8)
```

```
##
##      Multiple regression power calculation
##
##              u = 1
##              v = 43.35263
##              f2 = 0.4285714
##      sig.level = 0.001
##      power = 0.8
```

Where:

- u = number of predictors
- $f2$ = effect size (Cohen's $f2$)
- sig.level = significance level (α)
- power = desired power ($1 - \beta$)

Recall $n = v + u + 1$. Therefore, we need $43.35263 + 1 + 1 = 45.35263 \sim 45$ words.

2.3.2.2.2 Using our LM model In our case, we use the dataset `english` from the `languageR` package. We used `AgeSubject` as our predictor to predict `RTlexdec`. What if we want to compute the power of our model that we ran previously? Here is the summary of our model

```
summary(model)

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
```

```
## (Intercept)      6.660958    0.002324 2866.44    <2e-16 ***
## AgeSubjectyoung -0.221721    0.003286  -67.47    <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF,  p-value: < 2.2e-16
```

2.3.2.2.2.1 Power analysis from our model Recall that the F test has numerator and denominator degrees of freedom. The numerator degrees of freedom, u , is the number of coefficients you'll have in your model (minus the intercept).

The effect size, f^2 , is $R^2/(1 - R^2)$, where R^2 is the coefficient of determination, aka the “proportion of variance explained”. To determine effect size you hypothesize the proportion of variance your model explains, or the R^2 .

Once we computed these three values, we can compute the power of our model based on its summary.

```
u <- summary(model)$fstatistic[2]
v <- summary(model)$fstatistic[3]
f2 <- summary(model)$r.squared/(1 - summary(model)$r.squared)
# p.value <- summary(model)$coefficients[2,4]
p.value <- 0.0001
pwrModel <- pwr.f2.test(u = u, v = v, f2 = f2, sig.level = p.value)
pwrModel
```

```
##
##      Multiple regression power calculation
##
##              u = 1
##              v = 4566
##              f2 = 0.9969247
##      sig.level = 1e-04
##              power = 1
```

2.3.2.2.2.2 Sample size For the optimal sample size, we use the same values for u , f^2 and $p.value$ as above, but we specify the power we want to have. Here, we use the power we obtained from our model above.

```
pwrSample <- pwr.f2.test(u = u, f2 = f2, sig.level = p.value, power = pwrModel$power)
pwrSample
```

```
##
##      Multiple regression power calculation
##
```

```
##          u = 1
##          v = 1e+09
##          f2 = 0.9969247
##    sig.level = 1e-04
##          power = 1
```

Based on the output, we can compute the optimal sample size needed for our model as

```
n <- pwrSample$v + u + 1
n
```

```
## numdf
## 1e+09
```

The optimal sample size to reach this level of power is **1,000,000,000 words!** BUT we do not have that many words in our dataset. This is kind of telling us that there are serious issues in our model. In fact, we see that we have a power of 1, which is very high power. However, we know very well that our linear model is inaccurate. We did not tell our model that the data comes from multiple words, and that we really need to compute a mixed effects regression (see **Section 3.3** from **chapter 3**).

2.4 Correlation tests

2.4.1 Correlation does not imply causation!

There is a general misconception that when one conducts a correlation test (see below), we can explain causation. An excellent example is borrowed from wikipedia. It is not because two variables are correlated (positively or negatively) that one explains the reasons behind the second!

If you want to evaluate the cause of an effect then inferential statistics that we cover after the correlation tests are the ones to go for.

2.4.2 Basic correlations

Let us start with a basic correlation test. We want to evaluate if two numeric variables are correlated with each other.

We use the function `cor` to obtain the pearson correlation and `cor.test` to run a basic correlation test on our data with significance testing

```
cor(english$RTlexdec, english$RTnaming, method = "pearson")
```

```
## [1] 0.7587033
```

```
cor.test(english$RTlexdec, english$RTnaming)

##
## Pearson's product-moment correlation
##
## data: english$RTlexdec and english$RTnaming
## t = 78.699, df = 4566, p-value < 2.2e-16
## alternative hypothesis: true correlation is not equal to 0
## 95 percent confidence interval:
##  0.7461195 0.7707453
## sample estimates:
##          cor
## 0.7587033
```

What these results are telling us? There is a positive correlation between `RTlexdec` and `RTnaming`. The correlation coefficient (R^2) is 0.76 (limits between -1 and 1). This correlation is statistically significant with a t value of 78.699, degrees of freedom of 4566 and a p-value < 2.2e-16.

What are the degrees of freedom? These relate to number of total observations - number of comparisons. Here we have 4568 observations in the dataset, and two comparisons, hence 4568 - 2 = 4566.

For the p value, there is a threshold we usually use. This threshold is $p = 0.05$. This threshold means we have a minimum to consider any difference as significant or not. 0.05 means that we have a probability to find a significant difference that is at 5% or lower. IN our case, the p value is lower than 2.2e-16. How to interpret this number? this tells us to add 15 0s before the 2!! i.e., 0.0000000000000002. This probability is very (very!!) low. So we conclude that there is a statistically significant correlation between the two variables.

The formula to calculate the t value is below.

$$t = \frac{\bar{x} - \mu_0}{s / \sqrt{n}}$$

$\bar{x}$ = sample mean μ_0 = population mean s = sample standard deviation n = sample size

The p value is influenced by various factors, number of observations, strength of the difference, mean values, etc.. You should always be careful with interpreting p values taking everything else into account.

2.4.3 Using the package `corrplot`

Above, we did a correlation test on two predictors. What if we want to obtain a nice plot of all numeric predictors and add significance levels?

2.4.3.1 Correlation plots

```
corr <-  
  english %>%  
  select(where(is.numeric)) %>%  
  cor()  
corrplot(corr, method = 'ellipse', type = 'upper')
```

2.4.3.2 More advanced

Let's first compute the correlations between all numeric variables and plot these with the p values

```
## correlation using "corrplot"
## based on the function `rcorr` from the `Hmisc` package
## Need to change dataframe into a matrix
corr <-
  english %>%
    select(where(is.numeric)) %>%
    data.matrix(english) %>%
    rcorr(type = "pearson")
# use corrplot to obtain a nice correlation plot!
corrplot(corr$r, p.mat = corr$p,
          addCoef.col = "black", diag = FALSE, type = "upper", tl.srt = 55)
```

```
english %>%
  group_by(AgeSubject) %>%
  summarise(mean = mean(RTlexdec),
            sd = sd(RTlexdec))
```

```
## # A tibble: 2 x 3
##   AgeSubject mean    sd
```

```
##    <fct>      <dbl> <dbl>
## 1 old        6.66 0.116
## 2 young      6.44 0.106
```

2.5 Linear Models

Up to now, we have looked at descriptive statistics, and evaluated summaries, correlations in the data (with p values).

We are now interested in looking at group differences. But before moving into linear models, let's assume we simply wanted to use a student's t.test to evaluate the differences between two groups. In our case, we have two age groups within the variable `AgeSubject` (young vs old). Before running a t.test, there are some assumptions one needs to take into account:

2.5.1 Normality of distribution

2.5.1.1 Shapiro test

To check normality of distribution, we use the `shapiro.test` on the numeric outcome. Given that our predictor now has two levels.

```
shapiro.test(english$RTlexdec)
```

```
##
##  Shapiro-Wilk normality test
##
## data:  english$RTlexdec
## W = 0.98595, p-value < 2.2e-16
```

How to interpret this statistically significant result? This tells us that the distribution of the data is statistically different from a normal distribution.

2.5.1.2 Density plot

We can also use a density plot to evaluate normality. The results show that both levels have bell shaped distributions but they are both skewed to the right (positively skewed data). See this website for a nice example of left and right skewed data distributions.

```
english %>%
  ggplot(aes(x = RTlexdec)) +
  geom_density() +
  facet_wrap(~ AgeSubject)
```

2.5.2 Homogeneity of variance

If our data were normally distributed, we can use the `bartlett` test. If our data were non-normally distributed, we would use the Levene Test (either with `var.test` from base-R or `leveneTest` from the `car` package). We can check both.

2.5.2.1 Bartlett test

```
english %>%
  bartlett.test(RTlexdec ~ AgeSubject, data = .)

##
## Bartlett test of homogeneity of variances
##
## data: RTlexdec by AgeSubject
## Bartlett's K-squared = 15.883, df = 1, p-value = 6.737e-05
```

2.5.2.2 Levene test

```
english %>%
  var.test(RTlexdec ~ AgeSubject, data = .)
```

2.5.2.2.1 Base R

```
##
```

```
## F test to compare two variances
##
## data:  RTlexdec by AgeSubject
## F = 1.1817, num df = 2283, denom df = 2283, p-value = 6.737e-05
## alternative hypothesis: true ratio of variances is not equal to 1
## 95 percent confidence interval:
##  1.088581 1.282737
## sample estimates:
## ratio of variances
##          1.181678
```

```
english %>%
  car::leveneTest(RTlexdec ~ AgeSubject, data = .)
```

2.5.2.2.2 From the car package

```
## Levene's Test for Homogeneity of Variance (center = median)
##           Df F value  Pr(>F)
## group      1  5.1615 0.02314 *
##           4566
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

In all cases, the statistically significant result indicates that there is evidence that the variance of two levels of the factor `AgeSubject` is statistically significant; i.e., the variances are not equal. This is important as we will use this in our t-test later on.

2.5.3 First steps

Up to now, we have looked at descriptive statistics, and evaluated summaries, correlations in the data (with p values), and checked the normality of distribution of our data.

We are now interested in looking at group differences.

Let us start with a simple t-test

2.5.3.1 T-test

We then run a t-test on the data. We specify the formula as `y ~ x` and add `var.equal = FALSE` (based on the normality tests above)

```
english %>%
  t.test(RTlexdec ~ AgeSubject, data = ., var.equal = FALSE)
```

```
##
## Welch Two Sample t-test
```

```
##
## data: RTlexdec by AgeSubject
## t = 67.468, df = 4534.6, p-value < 2.2e-16
## alternative hypothesis: true difference in means between group old and group young :
## 95 percent confidence interval:
##  0.2152787 0.2281642
## sample estimates:
##      mean in group old mean in group young
##      6.660958          6.439237
```

To interpret the t-test, we say that there is evidence for a statistically significant difference between the two groups: young and old: $t(4534.6) = 67.468$, $p < 2.2e-16$. The mean of RTlexdec for the young group is significantly lower than that of the old group.

2.5.3.2 Linear Model

Let us run a linear model on the same data

```
english %>%
  lm(RTlexdec ~ AgeSubject, data = .) %>%
  summary()

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)    6.660958   0.002324  2866.44  <2e-16 ***
## AgeSubjectyoung -0.221721   0.003286  -67.47   <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF, p-value: < 2.2e-16
```

Any comments? discuss with your neighbour.

The results of the linear model are exactly the same, albeit with a difference in the sign of the difference. This indicates that the β coefficient for young is significantly lower than that of old by -0.221721 : $t = -67.47$, $p < <2e-16$.

The dataset `english` contains two levels for `AgeSubject`. We will run an ANOVA and a linear model on the data.

2.5.3.3 Basic ANOVA

We can use the function `aov` to run an Analysis of Variance on the full dataset

```
english %>%
  aov(RTlexdec ~ AgeSubject, data = .) %>%
  summary()

##              Df Sum Sq Mean Sq F value Pr(>F)
## AgeSubject    1  56.14   56.14    4552 <2e-16 ***
## Residuals  4566   56.31    0.01
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

2.5.3.4 Linear model

We can use the function `lm` to run a linear model

```
english %>%
  lm(RTlexdec ~ AgeSubject, data = .) %>%
  summary()

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)    6.660958   0.002324  2866.44 <2e-16 ***
## AgeSubjectyoung -0.221721   0.003286  -67.47  <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF, p-value: < 2.2e-16
```

But wait... How is the linear model comparable to the analysis of variance we ran above? This linear model derives the analysis of variance we saw above, use `anova` on your linear model..

Here are the results of the initial Analysis of variance:

```

english %>%
  aov(RTlexdec ~ AgeSubject, data = .) %>%
  summary()

##              Df Sum Sq Mean Sq F value Pr(>F)
## AgeSubject    1  56.14   56.14    4552 <2e-16 ***
## Residuals  4566  56.31    0.01
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

```

And here are the results of the linear model with the `anova` function

```

english %>%
  lm(RTlexdec ~ AgeSubject, data = .) %>%
  anova()

## Analysis of Variance Table
##
## Response: RTlexdec
##              Df Sum Sq Mean Sq F value    Pr(>F)
## AgeSubject    1  56.141   56.141    4552 < 2.2e-16 ***
## Residuals  4566  56.314    0.012
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

```

They are exactly the same... The underlying of an Analysis of variance is a linear model. We will continue with a linear model to understand it better

2.5.4 Introduction to Linear models

The basic assumption of a Linear model is to create a regression analysis on the data. We have an outcome (or dependent variable) and a predictor (or an independent variable). The formula of a linear model is as follows `outcome ~ predictor` that can be read as “outcome as a function of the predictor”. We can add “1” to specify an intercept, but this is by default added to the model

2.5.4.1 Model estimation

```

english2 <- english %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old")))
mdl.lm <- english2 %>%
  lm(RTlexdec ~ AgeSubject, data = .)
#lm(RTlexdec ~ AgeSubject, data = english)
mdl.lm #also print(mdl.lm)

##
## Call:

```

```
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Coefficients:
## (Intercept) AgeSubjectold
##      6.4392      0.2217
summary mdl.lm

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)   6.439237   0.002324 2771.03  <2e-16 ***
## AgeSubjectold 0.221721   0.003286   67.47  <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF, p-value: < 2.2e-16
```

2.5.5 Role of coding schemes

2.5.5.1 Intro

There are other coding schemes that can be used. See Schad et al. (2020): “How to capitalize on a priori contrasts in linear (mixed) models: A tutorial”. *Journal of Memory and Language*, vol. 110, 104038.

We have:

1. The treatment coding
2. The contrast or sum coding
3. The polynomial coding
4. The Repeated coding
5. The helmert coding

The first two are the most commonly used coding schemes, but see the paper for why one can use the others.

2.5.5.2 Treatment coding

By default, R uses a treatment coding scheme. By this we mean that the intercept has the outcome of a specific level in the dataset (usually, the first in alphabetical order, unless you have changed that!). In our example above, we changed the reference level of the variable `AgeSubject` to be “young” vs “old”. What we see as a result in our LM is the intercept (=Young) vs “AgeSubjectold”. This will mean we are looking at the difference between the reference level and all other levels.

The code below allows you to see what the coding scheme is.

```
english2$AgeSubject2 <- english2$AgeSubject

contrasts(english2$AgeSubject2) <- contr.treatment(2)
contrasts(english2$AgeSubject2)

##          2
## young  0
## old    1

mdl.lm.T <- english2 %>%
  lm(RTlexdec ~ AgeSubject2, data = .)
#lm(RTlexdec ~ AgeSubject, data = english)
mdl.lm.T #also print(mdl.lm)

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject2, data = .)
##
## Coefficients:
## (Intercept)  AgeSubject2
##      6.4392      0.2217

summary(mdl.lm.T)

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject2, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  6.439237   0.002324 2771.03  <2e-16 ***
## AgeSubject2  0.221721   0.003286   67.47  <2e-16 ***
## ---
```

```
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF, p-value: < 2.2e-16
```

2.5.5.3 Contrast (or sum) coding

2.5.5.3.1 Default Let's change the coding scheme and see the difference in the output.

```
english2 <- english2 %>%
  mutate(AgeSubject2 = factor(AgeSubject2, levels = c("old", "young")))

contrasts(english2$AgeSubject2) <- contr.sum(2)
contrasts(english2$AgeSubject2)
```

```
##      [,1]
## old      1
## young   -1
```

```
mdl.lm.C <- english2 %>%
  lm(RTlexdec ~ AgeSubject2, data = .)
#lm(RTlexdec ~ AgeSubject, data = english)
mdl.lm.C #also print(mdl.lm)
```

```
##
## Call:
## lm(formula = RTlexdec ~ AgeSubject2, data = .)
##
## Coefficients:
## (Intercept) AgeSubject21
##      6.5501      0.1109
```

```
summary(mdl.lm.C)
```

```
##
## Call:
## lm(formula = RTlexdec ~ AgeSubject2, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  6.550097   0.001643 3986.29  <2e-16 ***
## AgeSubject21  0.110861   0.001643  67.47  <2e-16 ***
```

```
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF, p-value: < 2.2e-16
```

With contrast (or sum) coding, the intercept is almost the same as before (treatment = 6.439237 vs contrast = 6.550097). The intercept is now the average of all of the data points

```
english2 %>%
  mutate(meanRTlexdec = mean(RTlexdec)) %>%
  select(meanRTlexdec) %>%
  head(10)
```

```
##      meanRTlexdec
## 1      6.550097
## 2      6.550097
## 3      6.550097
## 4      6.550097
## 5      6.550097
## 6      6.550097
## 7      6.550097
## 8      6.550097
## 9      6.550097
## 10     6.550097
```

The coefficient for `old` is different. It is now nearly half of that in the treatment coding (0.221721 vs 0.110861). Why is this the case? In treatment coding, the distance between `old` and `young` was of 1 ($1 - 0 = 1$), in contrast coding, it is of 2 ($1 - -1 = 2$). The coefficient of the intercept is exactly the same; for the second, it is half of the one above ($0.221721 / 1 = 0.221721$; $0.221721 / 2 = 0.110861$)!

How to interpret the coefficient for the level “old”? It is the distance from the average!

Let’s change slightly the coding scheme

```
english2 <- english2 %>%
  mutate(AgeSubject2 = factor(AgeSubject, levels = c("young", "old")))

contrasts(english2$AgeSubject2) <- c(-0.5, 0.5)
contrasts(english2$AgeSubject2)
```

2.5.5.3.2 Modified

```
##      [,1]
```

```
## young -0.5
## old    0.5

mdl.lmC.2 <- english2 %>%
  lm(RTlexdec ~ AgeSubject2, data = .)
#lm(RTlexdec ~ AgeSubject, data = english)
mdl.lmC.2 #also print(mdl.lmC.2)

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject2, data = .)
##
## Coefficients:
## (Intercept) AgeSubject21
##          6.5501          0.2217

summary(mdl.lmC.2)

##
## Call:
## lm(formula = RTlexdec ~ AgeSubject2, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.25776 -0.08339 -0.01669  0.06921  0.52685
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  6.550097   0.001643  3986.29  <2e-16 ***
## AgeSubject21  0.221721   0.003286   67.47  <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.1111 on 4566 degrees of freedom
## Multiple R-squared:  0.4992, Adjusted R-squared:  0.4991
## F-statistic: 4552 on 1 and 4566 DF, p-value: < 2.2e-16
```

Our intercept is still the average of all datapoints of the dependent variable; that of “old” is now at 0.221721 as expected. The distance between young and old is of 1 ($0.5 - -0.5 = 1$).

When and why do we use the different coding schemes? We use it to make the intercept more interpretable. This is especially the case when having more than two categorical predictors, or interactions between a numeric and a categorical predictor. Read the paper and the Bodo Winter’s book for more details.

2.5.6 Further steps

2.5.6.1 Tidying the output

We use our original model with treatment coding.

```
# from library(broom)
tidy mdl.lm) %>%
  select(term, estimate) %>%
  mutate(estimate = round(estimate, 3))

## # A tibble: 2 x 2
##   term          estimate
##   <chr>         <dbl>
## 1 (Intercept)    6.44
## 2 AgeSubjectold  0.222

mycoefE <- tidy(mdl.lm) %>% pull(estimate)
```

Obtaining mean values from our model

```
#old
mycoefE[1]

## [1] 6.439237

#young
mycoefE[1] + mycoefE[2]

## [1] 6.660958
```

2.5.6.2 Nice table of our model summary

We can also obtain a nice table of our model summary. We can use the package `knitr` or `xtable`

```
kable(summary(mdl.lm)$coef, digits = 3)
```

2.5.6.2.1 Directly from model summary

	Estimate	Std. Error	t value	
(Intercept)	6.439	0.002	2771.027	
AgeSubjectold	0.222	0.003	67.468	

```
mdl.lmT <- tidy(mdl.lm)
kable(mdl.lmT, digits = 3)
```

2.5.6.2.2 From the tidy output

term	estimate	std.error	statistic	p.value
(Intercept)	6.439	0.002	2771.027	0
AgeSubjectold	0.222	0.003	67.468	0

```
print(tab_model mdl.lm, file = paste0("outputs/mdl_lm.html"))
htmltools::includeHTML("outputs/mdl_lm.html")
```

2.5.6.2.3 Model's fit

2.5.6.3 Dissecting the model

Let us dissect the model. If you use “str”, you will be able to see what is available under our linear model. To access some info from the model

```
str(mdl.lm)
```

2.5.6.3.1 “str” and “coef”

```

##      Estimate Std. Error      t value      Pr(>|t|)
## 0.22172146  0.00328631  67.46820211  0.00000000
summary mdl.lm $coefficients [2, 4] # for p value

## [1] 0
```

2.5.6.3.3 Residuals What about residuals (difference between the observed value and the estimated value of the quantity) and fitted values? This allows us to evaluate how normal our residuals are and how different they are from a normal distribution.

```
hist(residuals mdl.lm)
```

2.5.6.3.3.1 Histogram

```
qqnorm(residuals mdl.lm); qqline(residuals mdl.lm)
```

2.5.6.3.3.2 qqplots

```
plot(fitted(mdl.lm), residuals(mdl.lm), cex = 4)
```

2.5.6.3.3.3 Residuals vs fitted values

```
sim_residuals <- simulateResiduals(mdl.lm)
plot(sim_residuals)
```

2.5.6.3.3.4 Generating and plotting residual plot with DHARMA DHARMA residual

```
AIC(md1.lm) # Akaike's Information Criterion, lower values are better
```

2.5.6.3.4 Goodness of fit?

```
## [1] -7110.962
```

```
BIC(md1.lm) # Bayesian AIC
```

```
## [1] -7091.682
```

```
logLik(md1.lm) # log likelihood
```

```
## 'log Lik.' 3558.481 (df=3)
```

Or use the following from broom

```
glance(md1.lm)
```

```
## # A tibble: 1 x 12
##   r.squared adj.r.squared sigma statistic p.value    df logLik   AIC   BIC
##   <dbl>      <dbl> <dbl>    <dbl>   <dbl> <dbl> <dbl> <dbl> <dbl>
## 1    0.499      0.499 0.111    4552.     0     1  3558. -7111. -7092.
## # i 3 more variables: deviance <dbl>, df.residual <int>, nobs <int>
```

2.5.6.3.5 Significance testing Are the above informative? of course not directly. If we want to test for overall significance of model. We run a null model (aka intercept only) and compare models.

```
mdl.lm.Null <- english %>%
  lm(RTlexdec ~ 1, data = .)
mdl.comp <- anova(mdl.lm.Null, mdl.lm)
mdl.comp

## Analysis of Variance Table

##   Res.Df    RSS Df Sum of Sq   F    Pr(>F)
## 1     4567 112.456
## 2     4566  56.314   1    56.141 4552 < 2.2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

The results show that adding the variable “AgeSubject” improves the model fit. We can write this as follows: Model comparison showed that the addition of AgeSubject improved the model fit when compared with an intercept only model ($F(1) = 4551.96$, $p < 0$) ($F(1) = 4552$, $p < 2.2e-16$)

2.5.7 Plotting fitted values

2.5.7.1 Trend line

Let’s plot our fitted values but only for the trend line

```
english %>%
  ggplot(aes(x = AgeSubject, y = RTlexdec))+
  geom_boxplot()+
  theme_bw() + theme(text = element_text(size = 15))+
  geom_smooth(aes(x = as.numeric(AgeSubject), y = predict(mdl.lm)), method = "lm", col = "red",
  labs(x = "Age", y = "RTLexDec", title = "Boxplot and predicted trend line", subtitle = "Trend line for RTLexDec vs Age")
```

This allows us to plot the fitted values from our model with the predicted linear trend. This is exactly the same as our original data.

2.5.7.2 Predicted means and the trend line

We can also plot the predicted means and linear trend

```
english %>%
  ggplot(aes(x = AgeSubject, y = predict mdl.lm)) +
  geom_boxplot(color = "blue") +
  theme_bw() + theme(text = element_text(size = 15)) +
  geom_smooth(aes(x = as.numeric(AgeSubject), y = predict mdl.lm)), method = "lm", color = "blue",
  labs(x = "Age", y = "RTLexDec", title = "Predicted means and trend line", subtitle = "with gg")
```

Predicted means and trend line with ggplot2

2.5.7.3 Raw data, predicted means and the trend line

We can also plot the actual data, the predicted means and linear trend

```
english %>%
  ggplot(aes(x = AgeSubject, y = RTlexdec)) +
  geom_boxplot() +
  geom_boxplot(aes(x = AgeSubject, y = predict(md1.lm)), color = "blue") +
  theme_bw() + theme(text = element_text(size = 15)) +
  geom_smooth(aes(x = as.numeric(AgeSubject), y = predict(md1.lm)), method = "lm", color = "blue") +
  labs(x = "Species", y = "Length", title = "Boxplot raw data, predicted means (in blue) and linear trend")
```

Boxplot raw data, predicted means (in blue) and trend line with ggplot2

2.5.7.4 Add significance levels and trend line on a plot?

We can use the p values generated from either our linear model to add significance levels on a plot. We use the code from above and add the significance level. We also add a trend line

```
english %>%
  ggplot(aes(x = AgeSubject, y = RTlexdec)) +
  geom_boxplot() +
  geom_boxplot(aes(x = AgeSubject, y = predict mdl.lm)), color = "blue") +
  theme_bw() + theme(text = element_text(size = 15)) +
  geom_smooth(aes(x = as.numeric(AgeSubject), y = predict mdl.lm)), method = "lm", color = "blue") +
  labs(x = "Species", y = "Length", title = "Boxplot raw data, predicted means (in blue) and trend line") +
  geom_signif(comparison = list(c("old", "young")),
    map_signif_level = TRUE, test = function(a, b) {
      list(p.value = summary mdl.lm)$coefficients[2, 4]
    })
```

Boxplot raw data, predicted means (in blue) and trend with significance testing

2.5.8 What about pairwise comparison?

When having three or more levels in our predictor, we can use pairwise comparisons, with corrections to evaluate differences between each level.

```
summary(mdl.lm)
```

```
##
## Call:
## lm(formula = RTlexdec ~ AgeSubject, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max

```

How to interpret the output? Discuss with your neighbour and share with the group.

Hint... Look at the emmeans values for each level of our factor “AgeSubject” and the contrasts.

2.5.9 Multiple predictors?

Linear models require a numeric outcome, but the predictor can be either numeric or a factor. We can have more than one predictor. The only issue is that this complicates the interpretation of results

```
english %>%
  lm(RTlexdec ~ AgeSubject * WordCategory, data = .) %>%
  summary()
```

```
##
## Call:
## lm(formula = RTlexdec ~ AgeSubject * WordCategory, data = .)
##

## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

The results above tell us that all predictors used are significantly different.

2.6 Generalised Linear Models

Here we will look at an example when the outcome is binary. This simulated data is structured as follows. We asked one participant to listen to 165 sentences, and to judge whether these are “grammatical” or “ungrammatical”. There were 105 sentences that were “grammatical” and 60 “ungrammatical”. Responses varied, with 110 “yes” responses and 55 “no” responses, spread across the grammatical.

This fictitious example can apply in any other situation. Let’s think Geography: 165 lands: 105 “flat” and 60 “non-flat”, etc. This applies to any case where you need to “categorise” the outcome into two groups.

2.6.1 Load and summaries

Let’s create this dataset from scratch (you can load the “grammatical.csv file as well) and do some basic summaries

```
grammatical <- as.data.frame(
  cbind("grammaticality" = c("grammatical" = rep("grammatical", 105),
                                "ungrammatical" = rep("ungrammatical", 60)),
        "response" = c("yes" = rep("yes", 100),
                        "no" = rep("no", 5),
                        "yes" = rep("yes", 10),
                        "no" = rep("no", 50))),
  row.names = FALSE)
```

```
grammatical %>%
  head(20)
```

```
##      grammaticality response
## 1      grammatical      yes
## 2      grammatical      yes
## 3      grammatical      yes
## 4      grammatical      yes
## 5      grammatical      yes
## 6      grammatical      yes
## 7      grammatical      yes
## 8      grammatical      yes
## 9      grammatical      yes
## 10     grammatical      yes
## 11     grammatical      yes
## 12     grammatical      yes
## 13     grammatical      yes
## 14     grammatical      yes
## 15     grammatical      yes
## 16     grammatical      yes
## 17     grammatical      yes
## 18     grammatical      yes
## 19     grammatical      yes
## 20     grammatical      yes
```

```
str(grammatical)
```

```
## 'data.frame':   165 obs. of  2 variables:
## $ grammaticality: chr "grammatical" "grammatical" "grammatical" "grammatical" ...
## $ response      : chr "yes" "yes" "yes" "yes" ...
```

```
head(grammatical)
```

```
##      grammaticality response
## 1      grammatical      yes
## 2      grammatical      yes
## 3      grammatical      yes
## 4      grammatical      yes
## 5      grammatical      yes
## 6      grammatical      yes
```

```
table(grammatical$response, grammatical$grammaticality)
```

```
##
##      grammatical ungrammatical
## no              5              50
## yes            100             10
```

2.6.2 GLM - Categorical predictors

Let's run a first GLM (Generalised Linear Model). A GLM uses a special family "binomial" as it assumes the outcome has a binomial distribution. In general, results from a Logistic Regression are close to what we get from SDT (see above).

To run the results, we will change the reference level for both response and grammaticality. The basic assumption about GLM is that we start with our reference level being the "no" responses to the "ungrammatical" category. Any changes to this reference will be seen in the coefficients as "yes" responses to the "grammatical" category.

2.6.2.1 Model estimation and results

The results below show the logodds for our model.

```
grammatical <- grammatical %>%
  mutate(response = factor(response, levels = c("no", "yes")),
         grammaticality = factor(grammaticality, levels = c("ungrammatical", "grammatical")))

grammatical %>%
  group_by(grammaticality, response) %>%
  table()
```

```
##           response
## grammaticality no yes
## ungrammatical  50  10
## grammatical    5 100
```

```
mdl.glm <- grammatical %>%
  glm(response ~ grammaticality, data = ., family = binomial)
summary(mdl.glm)
```

```
##
## Call:
## glm(formula = response ~ grammaticality, family = binomial, data = .)
##
## Coefficients:
##              Estimate Std. Error z value Pr(>|z|)
## (Intercept)    -1.6094     0.3464  -4.646 3.38e-06 ***
## grammaticalitygrammatical  4.6052     0.5744   8.017 1.08e-15 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## (Dispersion parameter for binomial family taken to be 1)
##
##    Null deviance: 210.050  on 164  degrees of freedom
## Residual deviance:  94.271  on 163  degrees of freedom
```

```
## AIC: 98.271
##
## Number of Fisher Scoring iterations: 5
```

```
tidy mdl.glm %>%
  select(term, estimate) %>%
  mutate(estimate = round(estimate, 3))
```

```
## # A tibble: 2 x 2
##   term                estimate
##   <chr>              <dbl>
## 1 (Intercept)        -1.61
## 2 grammaticalitygrammatical    4.61
# to only get the coefficients
mycoef2 <- tidy mdl.glm %>% pull(estimate)
```

2.6.2.2 Model's fit

```
print(tab_model mdl.glm, file = paste0("outputs/mdl.glm.html"))
htmltools::includeHTML("outputs/mdl.glm.html")
```

The results show that for one unit increase in the response (i.e., from no to yes), the logodds of being “grammatical” is increased by 4.6051702 (the intercept shows that when the response is “no”, the logodds are -1.6094379). The actual logodds for the response “yes” to grammatical is 2.9957323

2.6.2.3 Logodds to Odd ratios

Logodds can be modified to talk about the odds of an event. For our model above, the odds of “grammatical” receiving a “no” response is a mere 0.2; the odds of “grammatical” to receive a “yes” is a 20; i.e., 20 times more likely

```
exp(mycoef2[1])
```

```
## [1] 0.2
```

```
exp(mycoef2[1] + mycoef2[2])
```

```
## [1] 20
```

2.6.2.4 LogOdds to proportions

If you want to talk about the percentage “accuracy” of our model, then we can transform our logodds into proportions. This shows that the proportion of “grammatical” receiving a “yes” response increases by 99% (or 95% based on our “true” coefficients)

```
plogis(mycoef2[1])

## [1] 0.1666667
plogis(mycoef2[1] + mycoef2[2])

## [1] 0.952381
```

2.6.2.5 Plotting

```
grammatical <- grammatical %>%
  mutate(prob = predict(mdl.glm, type = "response"))
grammatical %>%
  ggplot(aes(x = as.numeric(grammaticality), y = prob)) +
  geom_point() +
  geom_smooth(method = "glm",
    method.args = list(family = "binomial"),
    se = T) + theme_bw(base_size = 20) +
  labs(y = "Probability", x = "") +
  coord_cartesian(ylim = c(0,1)) +
  scale_x_discrete(limits = c("Ungrammatical", "Grammatical"))
```

2.6.3 GLM - Numeric predictors

In this example, we will run a GLM model using a similar technique to that used in Al-Tamimi (2017) and Baumann & Winter (2018). We use the package `LanguageR` and the dataset `English`.

In the model above, we used the equation as `lm(RTlexdec ~ AgeSubject)`. We were interested in examining the impact of age of subject on reaction time in a lexical decision task. In this section, we are interested in understanding how reaction time allows to differentiate the participants based on their age. We use `AgeSubject` as our outcome and `RTlexdec` as our predictor using the equation `glm(AgeSubject ~ RTlexdec)`. We usually can use `RTlexdec` as is, but due to a possible quasi separation and the fact that we may want to compare coefficients using multiple acoustic metrics, we will z-score our predictor. We run below two models, with and without z-scoring

For the glm model, we need to specify `family = "binomial"`.

2.6.3.1 Without z-scoring of predictor

```
mdl.glm2 <- english2 %>%
  glm(AgeSubject ~ RTlexdec, data = ., family = "binomial")

tidy(mdl.glm2) %>%
  select(term, estimate) %>%
  mutate(estimate = round(estimate, 3))
```

2.6.3.1.1 Model estimation

```
## # A tibble: 2 x 2
##   term      estimate
##   <chr>      <dbl>
## 1 (Intercept) -129.
## 2 RTlexdec    19.6

# to only get the coefficients
mycoef2 <- tidy(mdl.glm2) %>% pull(estimate)
```

```
print(tab_model(mdl.glm2, file = paste0("outputs/mdl.glm2.html")))
htmltools::includeHTML("outputs/mdl.glm2.html")
```

2.6.3.1.2 Model's fit

2.6.3.1.3 LogOdds to proportions If you want to talk about the percentage “accuracy” of our model, then we can transform our loggods into proportions.

```
plogis(mycoef2[1])

## [1] 1.368844e-56

plogis(mycoef2[1] + mycoef2[2])
```

```
## [1] 4.678715e-48
```

```
english2 <- english2 %>%
  mutate(prob = predict(mdl.glm2, type = "response"))
english2 %>%
  ggplot(aes(x = as.numeric(AgeSubject), y = prob)) +
  geom_point() +
  geom_smooth(method = "glm",
    method.args = list(family = "binomial"),
    se = T) + theme_bw(base_size = 20) +
  labs(y = "Probability", x = "") +
  coord_cartesian(ylim = c(0,1)) +
  scale_x_discrete(limits = c("Young", "Old"))
```

2.6.3.1.4 Plotting

The plot above show how the two groups differ using a glm. The results point to an overall increase in the proportion of reaction time when moving from the “Young” to the “Old” group. Let’s use z-scoring next

2.6.3.2 With z-scoring of predictor

```
english2 <- english2 %>%
  mutate(`RTlexdec_z` = scale(RTlexdec, center = TRUE, scale = TRUE))

english2['RTlexdec_z'] <- as.data.frame(scale(english2$RTlexdec))
```

```
mdl.glm3 <- english2 %>%
  glm(AgeSubject ~ RTlexdec_z, data = ., family = "binomial")

tidy(mdl.glm3) %>%
  select(term, estimate) %>%
  mutate(estimate = round(estimate, 3))
```

2.6.3.2.1 Model estimation

```
## # A tibble: 2 x 2
##   term      estimate
##   <chr>      <dbl>
## 1 (Intercept)  0.077
## 2 RTlexdec_z    3.08

# to only get the coefficients
mycoef2 <- tidy(mdl.glm3) %>% pull(estimate)
```

```
print(tab_model(mdl.glm3, file = paste0("outputs/mdl.glm3.html")))
htmltools::includeHTML("outputs/mdl.glm3.html")
```

2.6.3.2.2 Model's fit

2.6.3.2.3 LogOdds to proportions If you want to talk about the percentage “accuracy” of our model, then we can transform our logodds into proportions.

```
plogis(mycoef2[1])

## [1] 0.5192147

plogis(mycoef2[1] + mycoef2[2])

## [1] 0.959313
```

2.6.3.2.4 Plotting

```
english2 <- english2 %>%
  mutate(prob = predict(mdl.glm3, type = "response"))
english2 %>%
  ggplot(aes(x = as.numeric(AgeSubject), y = prob)) +
  geom_point() +
  geom_smooth(method = "glm",
    method.args = list(family = "binomial"),
```

```
se = T) + theme_bw(base_size = 20)+
labs(y = "Probability", x = "")+
coord_cartesian(ylim = c(0,1))+
scale_x_discrete(limits = c("Young", "Old"))
```

2.6.3.2.4.1 Normal

We obtain the exact same plots, but the model estimations are different. Let's use another type of predictions

```
z_vals <- seq(-3, 3, 0.01)

dfPredNew <- data.frame(RTlexdec_z = z_vals)

## store the predicted probabilities for each value of RTlexdec_z
pp <- cbind(dfPredNew, prob = predict(mdl.glm3, newdata = dfPredNew, type = "response"))

pp %>%
  ggplot(aes(x = RTlexdec_z, y = prob)) +
  geom_point() +
  theme_bw(base_size = 20)+
  labs(y = "Probability", x = "") +
  coord_cartesian(ylim = c(-0.1, 1.1), expand = FALSE) +
  scale_y_continuous(breaks = c(0,1), labels = c("Young", "Old")) +
  scale_x_continuous(breaks = c(-3, -2, -1, 0, 1, 2, 3))
```

2.6.3.2.4.2 z-scores

We obtain the exact same plots, but the model estimations are different.

2.6.4 Signal Detection Theory

2.6.4.1 Rationale

We are generally interested in performance, i.e., whether we have “accurately” categorised the outcome or not and at the same time want to evaluate our biases in responses. When deciding on categories, we are usually biased in our selection.

Let’s ask the question: How many of you have a Mac laptop and how many a Windows laptop? For those with a Mac, what was the main reason for choosing it? Are you biased in anyway by your decision?

To correct for these biases, we use some variants from Signal Detection Theory to obtain the true estimates without being influenced by the biases.

2.6.4.2 Running stats

Let’s do some stats on this

	Yes	No	Total
Grammatical (Yes Actual)	TP = 100	FN = 5	(Yes Actual) 105
Ungrammatical (No Actual)	FP = 10	TN = 50	(No Actual) 60
Total	(Yes Response) 110	(No Response) 55	165

```
grammatical <- grammatical %>%
  mutate(response = factor(response, levels = c("yes", "no")),
         grammaticality = factor(grammaticality, levels = c("grammatical", "ungrammatical")))
```

2.6.4.3 Below we obtain multiple measures

2.6.4.3.1 TP, FP, FN, TN TP = True Positive (Hit); FP = False Positive; FN = False Negative; TN = True Negative

```
TP <- nrow(grammatical %>%
  filter(grammaticality == "grammatical" &
         response == "yes"))
FN <- nrow(grammatical %>%
  filter(grammaticality == "grammatical" &
         response == "no"))
FP <- nrow(grammatical %>%
  filter(grammaticality == "ungrammatical" &
         response == "yes"))
TN <- nrow(grammatical %>%
  filter(grammaticality == "ungrammatical" &
         response == "no"))
```

```
TP
## [1] 100
FN
```

```
## [1] 5
FP
```

```
## [1] 10
TN
```

```
## [1] 50
```

2.6.4.3.2 Accuracy, Error, Sensitivity, Specificity, Precision, etc.

```
(TP+TN)/nrow(grammatical) # accuracy
```

2.6.4.3.2.1 Accuracy and Error

```
## [1] 0.9090909
(FP+FN)/nrow(grammatical) # error, also 1-accuracy
## [1] 0.09090909
```

```
# When stimulus = yes, how many times response = yes?
TP/(TP+FN) # also True Positive Rate or Specificity
```

2.6.4.3.2.2 Sensitivity, Specificity, Precision, etc.

```
## [1] 0.952381
```

```
# When stimulus = no, how many times response = yes?
FP/(FP+TN) # False Positive Rate,
```

```
## [1] 0.1666667
```

```
# When stimulus = no, how many times response = no?
TN/(FP+TN) # True Negative Rate or Sensitivity
```

```
## [1] 0.8333333
```

```
# When subject responds "yes" how many times is (s)he correct?
TP/(TP+FP) # precision
```

```
## [1] 0.9090909
```

2.6.4.3.2.3 STD measures We can get various measures from Signal Detection Theory. using the package `psycho`.

- `dprime` (or the sensitivity index)
- `beta` (bias criterion, 0-1, lower = increase in “yes”)
- `Aprime` (estimate of discriminability, 0-1, 1 = good discrimination; 0 at chance)
- `bppd` (b prime prime d, -1 to 1; 0 = no bias, negative = tendency to respond “yes”, positive = tendency to respond “no”)
- `c` (index of bias, equals to SD)

See here for more details

```
psycho::dprime(TP, FP, FN, TN,
               n_targets = TP+FN,
               n_distractors = FP+TN,
               adjust=F)
```

```
## $dprime
```

```

## $c
## [1] -0.3504848
```

The most important from above, is d-prime. This is modelling the difference between the rate of “True Positive” responses and “False Positive” responses in standard unit (or z-scores). The formula can be written as:

$$d' \text{ (d prime)} = Z(\text{True Positive Rate}) - Z(\text{False Positive Rate})$$

2.6.4.4 GLM and d prime

The values obtained here match those obtained from SDT. For d prime, the difference stems from the use of the logit variant of the Binomial family. By using a probit variant, one obtains the same values (see here for more details). A probit variant models the z-score differences in the outcome and is evaluated in change in 1-standard unit. This is modelling the change from “ungrammatical” “no” responses into “grammatical” “yes” responses in z-scores. The same conceptual underpinnings of d-prime from Signal Detection Theory.

```
## d prime
psycho::dprime(TP, FP, FN, TN,
               n_targets = TP+FN,
               n_distractors = FP+TN,
               adjust=F)$dprime

## [1] 2.635813

## GLM with probit
coef(glm(response ~ grammaticality, data = grammatical, family = binomial(probit)))[2]

## grammaticalityungrammatical
## 2.635813
```

2.6.4.5 GLM as a classification tool

The code below demonstrates the links between our GLM model and what we had obtained above from SDT. The predictions’ table shows that our GLM was successful at obtaining prediction that are identical to our initial data setup. Look at the table here and the table above. Once we have created our table of outcome, we can compute percent correct, the specificity, the sensitivity, the Kappa score, etc.. this yields the actual value with the SD that is related to variations in responses.

```
## predict mdl.glm > 0.5 is identical to
## predict(glm(response~grammaticality,data=grammatical,family = binomial),type="response")
grammatical <- grammatical %>%
  mutate(response = factor(response, levels = c("yes", "no")),
         grammaticality = factor(grammaticality, levels = c("grammatical", "ungrammatical")))

mdl.glm.C <- grammatical %>%
  glm(response ~ grammaticality, data = .,family = binomial)

tbl.glm <- table(grammatical$response, predict(mdl.glm.C, type = "response")>0.5)
colnames(tbl.glm) <- c("grammatical", "ungrammatical")
tbl.glm

##
##      grammatical ungrammatical
## yes           100             10
## no              5             50
PresenceAbsence::pcc(tbl.glm)

##      PCC      PCC.sd
## 1 0.9090909 0.0224484
PresenceAbsence::specificity(tbl.glm)

##      specificity specificity.sd
## 1 0.8333333 0.04851854
PresenceAbsence::sensitivity(tbl.glm)

##      sensitivity sensitivity.sd
## 1 0.952381 0.02088233
###etc..
```

If you look at the results from SDT above, these results are the same as the following

Accuracy: $(TP+TN)/\text{Total}$ (0.9090909)

True Positive Rate (or Specificity) $TP/(TP+FN)$ (0.952381)

True Negative Rate (or Sensitivity) $TN/(FP+TN)$ (0.8333333)

2.6.4.6 GLM: Other distributions

If your data does not fit a binomial distribution, and is a multinomial (i.e., three or more response categories) or poisson (count data), then you need to use the

glm function with a specific family function.

2.7 Cumulative Logit Link Models

These models work perfectly with rating data. Ratings are inherently ordered, 1, 2, ... n, and expect to observe an increase (or decrease) in overall ratings from 1 to n. To demonstrate this, we will use an example using the package “ordinal”.

We use two datasets. We previously ran these two models, however, in this subset of the full dataset, we did not take into account the fact that there were multiple producing speakers and items.

2.7.1 Ratings of percept of nasality

The first comes from a likert-scale a rating experiment where six participants rated the percept of nasality in the production of particular consonants in Arabic. The data came from nine producing subjects. The ratings were from 1 to 5, with 1 reflecting an oral percept; 5 a nasal percept.

2.7.1.1 Importing and pre-processing

We start by importing the data and process it. We change the reference level in the predictor

```
rating <- read_csv("data/rating.csv")[-1]
rating

## # A tibble: 405 x 5
##   Response Context   Subject Item      Rater
##   <dbl> <chr>      <chr> <chr>    <chr>
## 1      2 n-3      p04    noo3-w  R01
## 2      4 isolation p04    noo3-v  R01
## 3      2 o-3      p04    djuu3-w R01
## 4      4 isolation p04    djuu3-v R01
## 5      3 n-7      p04    nuu7-w  R01
## 6      3 isolation p04    nuu7-v  R01
## 7      1 3--3      p04    3oo3-w  R01
## 8      2 isolation p04    3oo3-v  R01
## 9      2 o-7      p04    loo7-w  R01
## 10     1 o-3      p04    bii3-w  R01
## # i 395 more rows

rating <- rating %>%
  mutate(Response = factor(Response),
         Context = factor(Context)) %>%
  mutate(Context = relevel(Context, "isolation"))
rating
```

```
## # A tibble: 405 x 5

```

2.7.1.4 Model’s fit

```
print(tab_model(mdl.clm, file = paste0("outputs/mdl.clm.html")))
htmltools::includeHTML("outputs/mdl.clm.html")
```

2.7.1.5 Interpreting a cumulative model

As a way to interpret the model, we can look at the coefficients and make sense of the results. A CLM model is a Logistic model with a cumulative effect. The “Coefficients” are the estimates for each level of the fixed effect; the “Threshold coefficients” are those of the response. For the former, a negative coefficient indicates a negative association with the response; and a positive is positively associated with the response. The p values are indicating the significance of each level. For the “Threshold coefficients”, we can see the cumulative effects of ratings 1|2, 2|3, 3|4 and 4|5 which indicate an overall increase in the ratings from 1 to 5.

2.7.1.5.1 Plotting

2.7.1.5.2 No confidence intervals We use a modified version of a plotting function that allows us to visualise the effects. For this, we use the base R plotting functions. The version below is without confidence intervals.

```
par(oma=c(1, 0, 0, 3),mgp=c(2, 1, 0))
xlimNas = c(min mdl.clm$beta, max mdl.clm$beta)
ylimNas = c(0,1)
plot(0,0,xlim=xlimNas, ylim=ylimNas, type="n", ylab=expression(Probability), xlab="", xaxt = "n",
axis(side = 1, at = c(0,mdl.clm$beta),labels = levels(rating$Context), las=2,cex=2,cex.lab=1.5,ce
xsNas = seq(xlimNas[1], xlimNas[2], length.out=100)
lines(xsNas, plogis(mdl.clm$Theta[1] - xsNas), col='black')
lines(xsNas, plogis(mdl.clm$Theta[2] - xsNas)-plogis(mdl.clm$Theta[1] - xsNas), col='red')
lines(xsNas, plogis(mdl.clm$Theta[3] - xsNas)-plogis(mdl.clm$Theta[2] - xsNas), col='green')
lines(xsNas, plogis(mdl.clm$Theta[4] - xsNas)-plogis(mdl.clm$Theta[3] - xsNas), col='orange')

Predicted curves – Nasalisation

2.7.2 Subjective estimates of the weight of the referents of 81 English nouns.

This dataset comes from the `LanguageR` package. It contains the subjective estimates of the weight of the referents of 81 English nouns. This dataset is a little complex. Data comes from multiple subjects who rated 81 nouns. The nouns are from a class of animals and plants. The subjects are either males or females.

We can model it in various ways. Here we decided to explore whether the ratings given to a particular word are different, when the class is either animal or a plant and if males rated the nouns differently from males.

2.7.2.1 Importing and pre-processing

```
weightRatings <- weightRatings %>%
  mutate(Rating = factor(Rating),
         Sex = factor(Sex),
         Class = factor(Class))
weightRatings %>%
  head(10)
```

##	Subject	Rating	Trial	Sex	Word	Frequency	Class

```

2.7.2.5 Interpreting a cumulative model

As a way to interpret the model, we can look at the coefficients and make sense of the results. A CLM model is a Logistic model with a cumulative effect. The “Coefficients” are the estimates for each level of the fixed effect; the “Threshold coefficients” are those of the response. For the former, a negative coefficient indicates a negative association with the response; and a positive is positively associated with the response. The p values are indicating the significance of each level. For the “Threshold coefficients”, we can see the cumulative effects of ratings 1|2, 2|3, 3|4 and 4|5 which indicate an overall increase in the ratings from 1 to 5.

2.7.2.6 Plotting

2.7.2.6.1 No confidence intervals We use a modified version of a plotting function that allows us to visualise the effects. For this, we use the base R plotting functions. The version below is without confidence intervals.

```
par(oma = c(4, 0, 0, 3), mgp = c(2, 1, 0))
xlim = c(min(mdl.clm2$beta), max(mdl.clm2$beta))
ylim = c(0, 1)
plot(0, 0, xlim = xlim, ylim = ylim, type = "n", ylab = expression(Probability), xlab =
axis(side = 1, at = mdl.clm2$beta, labels = names(mdl.clm2$beta), las = 2, cex = 0.75,
xs = seq(xlim[1], xlim[2], length.out = 100)
lines(xs, plogis(mdl.clm2$Theta[1] - xs), col = 'black')
lines(xs, plogis(mdl.clm2$Theta[2] - xs) - plogis(mdl.clm2$Theta[1] - xs), col = 'red')
lines(xs, plogis(mdl.clm2$Theta[3] - xs) - plogis(mdl.clm2$Theta[2] - xs), col = 'green')
lines(xs, plogis(mdl.clm2$Theta[4] - xs) - plogis(mdl.clm2$Theta[3] - xs), col = 'orange')
lines(xs, plogis(mdl.clm2$Theta[5] - xs) - plogis(mdl.clm2$Theta[4] - xs), col = 'yellow')
lines(xs, plogis(mdl.clm2$Theta[6] - xs) - plogis(mdl.clm2$Theta[5] - xs), col = 'grey')
lines(xs, 1 - (plogis(mdl.clm2$Theta[6] - xs)), col = 'blue')
abline(v = c(0, mdl.clm2$beta), lty = 3)
abline(h = 0, lty = "dashed")
abline(h = 0.2, lty = "dashed")
abline(h = 0.4, lty = "dashed")
abline(h = 0.6, lty = "dashed")
abline(h = 0.8, lty = "dashed")
abline(h = 1, lty = "dashed")

legend(par('usr')[2], par('usr')[4], bty = 'n', xpd = NA, lty = 1,
col = c("black", "red", "green", "orange", "yellow", "grey", "blue"),
legend = c("1", "2", "3", "4", "5", "6", "7"), cex = 0.75)
```

2.7.2.6.2 With confidence intervals Here is an attempt to add the 97.5% confidence intervals to these plots. This is an experimental attempt and any feedback is welcome!

```
par(oma = c(4, 0, 0, 3), mgp = c(2, 1, 0))
xlim = c(min mdl.clm2$beta, max mdl.clm2$beta)
ylim = c(0, 1)
plot(0, 0, xlim = xlim, ylim = ylim, type = "n", ylab = expression(Probability), xlab = "", xaxt = "n", yaxp = 1, at = mdl.clm2$beta, labels = names(mdl.clm2$beta), las = 2, cex = 0.75, cex.lab = 1)
xs = seq(xlim[1], xlim[2], length.out = 100)

Chapter 3

Random effects - LMM, GLMM, CLMM, GAMMs

This chapter introduces the reader to the basics of mixed-effects regressions. We explore what random effects are and how they contribute to our models. It demonstrates how what additional information we gain from a mixed effects model beyond the fixed effects. We heavily explore random effects using a Linear Mixed-Effects Regression model (LMM) using the package `lme4`. We also explore how to use the `ggstats` and `ggstatsplot` packages to visualise the results of our models. We also use the `sjPlot` package to visualise the results of our models. We explore other family distributions using Generalised Linear Mixed-effects Models (GLMMs) using the `lme4` package. Here we use various types of predictors: categorical predictors and numeric predictors. For the latter case, we look at how to use z-scored numeric predictors. We also explore how to use the `emmeans` package to visualise the results of our models. We then move to a cumulative link mixed-effects models (CLMMs). Towards the end, we introduce the user to Generalised Additive Mixed-effects Regressions (GAMMs). We use the package `mgcv` to explore how to use GAMMs. We also explore how to use the `itsadug` package to visualise the results of our models.

3.1 Loading packages

```
### Use the code below to check if you have all required packages installed. If some are not inst
requiredPackages = c('faux', 'tidyverse', 'broom', 'knitr', 'Hmisc', 'corrplot', 'lme4', 'lmerTes
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p, dependencies = TRUE)
  library(p,character.only = TRUE)
}
```

```
detach("package:lmerTest", unload = TRUE)
```

3.2 Random effects?

Random effects are used to account for the inter-dependencies in a dataset. In various domains, including linguistics, we often collect data from multiple Subjects, items, and utterances.

1. Multiple Subjects
2. Multiple Items (words)
3. Multiple utterances where words are embedded
4. Multiple listeners in perception experiments

In the last case, when designing our perception experiment, we can sometimes use multiple items, coming from multiple utterances and from multiple subjects!

When the data comes from multiple subjects, items, etc., there is a clear inter-dependency in the data. Without appropriately accounting for these, inter-dependencies, we are at a greater risk of increasing **Type I** Error and in some cases **Type 2** error (see chapter 3 on the various types of errors).

This is the equation that represents the error term associated with random effects:

$$y = x\beta + \varepsilon + Zu$$

where:

- $y \rightarrow$ outcome (DV) $\Rightarrow$ known
- $x \rightarrow$ fixed effect (IV) $\Rightarrow$ known
- $\beta \rightarrow$ coefficient of fixed effect $\Rightarrow$ unknown
- $\varepsilon \rightarrow$ random error term $\Rightarrow$ unknown
- $Z \rightarrow$ random effects term $\Rightarrow$ known
- $u \rightarrow$ random effects coefficients $\Rightarrow$ unknown

In a linear regression model (see chapter 3), the error term ε is a general error term related to the unexplained variance in the data. We see that this error term increases when we have inter-dependencies in the data unaccounted for (i.e., an increase in the ε leads to an increase in **Type I** error). In a random effects structure, some of this error is related to the Z and u . These two will lead to a decrease in the error term ε meaning that we allowed the model to account for the inter-dependencies in the data. However, in some instances, the unexplained variance in the data can decrease drastically with the error term associated with random effects increasing drastically. In these cases, there is a clear increase in **Type II** error.

3.2.1 How to choose fixed and random effects

3.2.1.1 Fixed effects

Fixed effects are those that are part of the experimental conditions. If you have exhausted all levels of an experimental condition, then this goes into fixed effects.

Covariates are a special case. Covariates are independent variables that co-vary with the population. For instance, a speaker can either be a male or a female (from a physiological sex perspective not accounting for sociolinguistic gender). This physiological gender then covaries with our subjects, and in some instances, can be used to allow for the coefficients to be adjusted to account for this type of dependency (or covariation).

3.2.1.2 Random effects

Random effects are random selections of the population you have and you want to generalise over them.

E.g., Speakers, listeners, items, utterances, corpora.... are all random effects because you are not using all the population of speakers, listeners, items, utterances or corpora in your data!

BUT.. Can Speakers, listeners, items, or utterances be included as fixed effects? Yes!! When you do this, it means you are interested in this specific population and want to evaluate differences specific to the population!!

3.2.2 What about Random Intercepts and Random Slopes

We often find references in the literature to specific notions of random intercepts and random slopes. To demonstrate what these mean (beyond the definitions), we look at an example. For example, using a simulated dataset (for more details see below under Linear Mixed-effects Models), figure A shows the predicted average Looking time. In the incongruent condition, there is a clear increase in the Looking time.

3.2.2.1 Random Intercepts

Random Intercepts are used to obtain averages of your population and these are used in your statistical model to estimate group-specific variations. These are represented in figure B. As can be seen here, the overall increase in looking time in the incongruent condition is confirmed and all subjects show this type of increase. However, what is important to note is that the intercepts (starting and ending times) per subject are different, but all subjects have the same slope. This is normal given that we did not allow subjects to covary with respect to the congruence-incongruence condition.

3.2.2.2 Random Intercepts and Random Slopes

When using Random Intercepts and Random Slopes, we mean that we allowed for averages per subject to be computed, in addition to allowing each subject's variability with regards to the fixed effect to covary. The figure C shows this clearly. Not only that subjects have different intercepts (starting and ending times); they also have different slopes with some showing steeper slopes and others shallower slopes.

Random slopes are adjustments to the subjects' observations as a function of the variable(s) of interest. Usually, any within-subject (or within-item) variable(s) is(are) to be included as a random slope(s), but you need to use model comparison to evaluate the need to use it.

```
plot_model(xmdl.Optimal, type = "pred", terms = "Cond", ci.lvl = 0.95, dodge = 0,
           show.legend = FALSE, title = "A. Predicted average LookingTime") + theme_bw() +
  geom_line() + coord_cartesian(ylim = c(-275, 2000)) +
plot_model(xmdl.rand.Interc, type = "pred", terms = c("Cond", "Subj"), pred.type = "re",
           ci.lvl = NA, dodge = 0, colors = paletteer_c("grDevices::rainbow",
                                                         length(unique(dataCong$Subj)))),
           show.legend = FALSE, title = "B. Subject Intercepts of LookingTime") + theme_bw() +
  geom_line() + coord_cartesian(ylim = c(-275, 2000)) +
plot_model(xmdl.Optimal, type = "pred", terms = c("Cond", "Subj"), pred.type = "re",
           ci.lvl = NA, dodge = 0, colors = paletteer_c("grDevices::rainbow",
                                                         length(unique(dataCong$Subj)))),
           show.legend = FALSE, title = "C. Subject Slopes of LookingTime") + theme_bw() +
  geom_line() + coord_cartesian(ylim = c(-275, 2000))
```

In the next section, we start by demonstrating the use of Linear Mixed-effects Models.

3.3 Linear Mixed-effects Models. Why random effects matter

Let's generate a new dataframe that we will use later on for our mixed models

We will use the `faux` package. It is available on CRAN, but it is possible that it is not available for your version of R (I used version 4.5). In this case, you need to install it via github. The package `faux` is a package that allows you to simulate data for your experiments. It is a very useful package to test your ideas and to assess the impact of particular predictors on your dependant variable.

To install it, you will first need to install the package `devtools`, and then install the package `faux` using the function `devtools::install_github`. Uncomment the code chunk below

```
# install.packages("devtools")
# devtools::install_github("debruine/faux")
# library(faux)
```

3.3.1 Dataframe (simulated)

Our experiment has the following structure: we asked 40 subjects to respond to 40 items in a fully crossed design. There were two IVs: Condition with `congruent` and `incongruent` and Age with `young` and `old`. The Condition is a within subject variable; age is a between subject. However, Condition and Age were both within item variables. The dependant variable was `LookingTime`.

This meant that we used items within each of the `young` and the `old` subjects in addition to items within each of the `congruent` and `incongruent` conditions.

Our research question is as follows: Age of subject will impact the `Looking Time` in the two conditions. Our hypothesis is: The older a subject is, the more the looking time it is to the `incongruent` condition.

We will use the package `faux` to simulate a dataframe. This step is crucial in assessing contributions of particular predictors and for testing ideas as we already know the distribution of the data and what to expect as an outcome when it comes to the fixed effect in question.

The simulated data has the following parameters

```
set.seed(42)
# define parameters
Subj_n = 40 # number of subjects
Item_n = 40 # number of items
b0 = 100    # intercept
b1 = 2.5 * b0 # fixed effect of condition
u0s_sd = 300 # random intercept SD for subjects
u0i_sd = 200 # random intercept SD for items
```

```

u1s_sd = 100 # random b1 slope SD for subjects
u1i_sd = 50 # random b1 slope SD for items
r01s = -0.3 # correlation between random effects 0 and 1 for subjects
r01i = 0.2 # correlation between random effects 0 and 1 for items
sigma_sd = 150 # error SD

# set up data structure
dataCong <- add_random(Subj = Subj_n, Item = Item_n) %>%
  # add within categorical variable for subject
  add_within("Subj", Cond = c("Congruent", "Incongruent")) %>%
  add_recode("Cond", "Cond.Incongruent", Congruent = 0, Incongruent = 1) %>%

3.3.1.2 Visualisations

3.3.1.2.1 Condition by Age The figure below confirms this, where we see an increase in LookingTime in the **incongruent** condition and overall, **older** participants show an increase in LookingTime

```
dataCong %>%
  ggplot(aes(x = Cond,
             y = LookingTime,
             colour = Age)) +
  theme_bw() +
  geom_boxplot() +
  geom_smooth(aes(as.numeric(Cond)), method = "lm")
```

3.3.1.2.2 Subject by Condition This figure shows that subjects are variable in how they responded to this task

```
dataCong %>%
  ggplot(aes(x = Cond,
             y = LookingTime,
             colour = Subj)) +
  theme_bw() +
  geom_point() +
  geom_smooth(aes(as.numeric(Cond)), method = "lm", se = FALSE) +
  scale_colour_manual(values = paletteer_c("grDevices::rainbow", length(unique(dataCong$Subj))))
```

3.3.1.2.3 Subject by Age This figure shows that subjects had an impact on the LookingTime in both age groups, simply due to their variable responses to the different items

```
dataCong %>%
  ggplot(aes(x = Age,
             y = LookingTime,
             colour = Subj)) +
  theme_bw() +
  geom_point() +
  geom_smooth(aes(as.numeric(Cond)), method = "lm", se = FALSE) +
  scale_colour_manual(values = paletteer_c("grDevices::rainbow", length(unique(dataCong
```

3.3. LINEAR MIXED-EFFECTS MODELS. WHY RANDOM EFFECTS MATTER 187

3.3.1.2.4 Item by Condition This figure shows that items had an impact on the LookingTime in both conditions

```
dataCong %>%
  ggplot(aes(x = Cond,
             y = LookingTime,
             colour = Item)) +
  theme_bw() +
  geom_point() +
  geom_smooth(aes(as.numeric(Cond)), method = "lm", se = FALSE) +
  scale_colour_manual(values = paletteer_c("grDevices::rainbow", length(unique(dataCong$Item))))
```

3.3.1.2.5 Subject by Age This figure shows that items had an impact on the LookingTime in both age groups

```
dataCong %>%
  ggplot(aes(x = Age,
             y = LookingTime,
             colour = Item)) +
  theme_bw() +
  geom_point() +
  geom_smooth(aes(as.numeric(Cond)), method = "lm", se = FALSE) +
  scale_colour_manual(values = paletteer_c("grDevices::rainbow", length(unique(dataCong
```

3.3.2 Modelling strategy

We use an LMER model with a crossed random effect. To choose our optimal model, we start first by a simple model with only random intercepts, increasing complexity by accounting for random slopes for both subjects and items. It is clear from our visualisation above, that there is no interaction between the two predictors. However, for demonstration purposes, we do test for this

3.3.2.1 Simple Linear Model

```
mdl.lm <- dataCong %>%
  lm(LookingTime ~ Cond + Age, data = .)
summary(mdl.lm)
```

```
##
## Call:
## lm(formula = LookingTime ~ Cond + Age, data = .)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -1215.59  -290.17   -21.78   264.89  1661.41
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
```

```
## (Intercept)      304.95      12.91    23.61 <2e-16 ***
## CondIncongruent  504.35      14.91    33.82 <2e-16 ***
## AgeOld           566.44      14.91    37.98 <2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

3.3.4.3.3.5 Item Slopes for Age

I hope this tutorial helped you to uncover the role of participants and items and

what they can tell us beyond the fixed effect!

3.3.5 Conclusion

In this simulated dataset, we showed how to use Linear Mixed-effects Models, and used a specific approach, named “maximal specification model”. This maximal specification model uses both random intercepts and random slopes. Usually, on any dataset, you are required to formally assess the need for Random slopes.

As a rule of thumb: Any within-subject (or within-item) should be tested for a potential inclusion as a random slope.

Fixed effects provide averages over all observations, even when using mixed effects regressions; we need to explore what random effects (intercepts and slopes) tell us.

In this example, we see that many subjects vary beyond the fixed effect; Standard Errors are not enough to quantify this type of variation. The same is true for items that are not explored routinely!

The approach above used a maximal specification model. This of course depends on the dataset you are working on and requires formal testing. See the package `RePsychLing` that is on github. The function `RePCA` is part of the package `lme4`. You can use it to verify if the model structure is appropriate. However, `lme4` will give you directly a warning “is singular” that you can interpret as “over specified model”.

3.4 Generalised Linear Mixed-effects Models

Here we will look at an example when the outcome is binary. This simulated data is structured as follows. We asked one participant to listen to 165 sentences, and to judge whether these are “grammatical” or “ungrammatical”. There were 105 sentences that were “grammatical” and 60 “ungrammatical”. This fictitious example can apply in any other situation. Let’s think Geography: 165 lands: 105 “flat” and 60 “non-flat”, etc. This applies to any case where you need to “categorise” the outcome into two groups.

3.4.1 GLMM - Categorical predictors

Let’s run a first GLMM (Generalised Linear Model).

3.4.1.1 Simulating a new dataset

```
grammatical2 <- as.data.frame(
  cbind("participant" = c("participant" = rep("p1", 165), rep("p2", 165)),
    "grammaticality" = c("grammatical" = rep("grammatical", 105),
```

```

"ungrammatical" = rep("ungrammatical", 60),
"grammatical" = rep("grammatical", 105),
"ungrammatical" = rep("ungrammatical", 60)),
  "response" = c("yes" = rep("yes", 100),
                 "no" = rep("no", 5),
                 "yes" = rep("yes", 10),
                 "no" = rep("no", 50),
                 "yes" = rep("yes", 90),
                 "no" = rep("no", 15),
                 "yes" = rep("yes", 30),
                 "no" = rep("no", 30))),
  row.names = FALSE)
grammatical2 %>%
  head(10)

```

```

##      participant grammaticality response
## 1          p1      grammatical      yes
## 2          p1      grammatical      yes
## 3          p1      grammatical      yes
## 4          p1      grammatical      yes
## 5          p1      grammatical      yes
## 6          p1      grammatical      yes
## 7          p1      grammatical      yes
## 8          p1      grammatical      yes
## 9          p1      grammatical      yes
## 10         p1      grammatical      yes

```

3.4.1.2 Manipulations and a table

```

grammatical2 <- grammatical2 %>%
  mutate(response = factor(response, levels = c("no", "yes")),
         grammaticality = factor(grammaticality, levels = c("ungrammatical", "grammatical")))
grammatical2 %>%
  select(response, grammaticality) %>%
  group_by(response, grammaticality) %>%
  table()

```

```

##           grammaticality
## response ungrammatical grammatical
##      no              80          20
##      yes             40         190

```

3.4.1.3 Model estimation and results

3.4.1.3.1 Random Intercepts The results below show the logodds for our model.

```

3.4.1.4 Model comparison

```
anova mdl.glmm, mdl.glmmSlope)
```

```
## Data: .
## Models:
## mdl.glmm: response ~ grammaticality + (1 | participant)
## mdl.glmmSlope: response ~ grammaticality + (grammaticality | participant)
##           npar    AIC    BIC  logLik -2*log(L)  Chisq Df Pr(>Chisq)
## mdl.glmm           3 290.84 302.24 -142.42    284.84
## mdl.glmmSlope       5 280.25 299.25 -135.13    270.25 14.584  2 0.0006811 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
anova mdl.glmmSlope, mdl.glmmSlopeDec)
```

```
## Data: .
## Models:
## mdl.glmmSlope: response ~ grammaticality + (grammaticality | participant)
## mdl.glmmSlopeDec: response ~ grammaticality + (grammaticality || participant)
##           npar    AIC    BIC  logLik -2*log(L)  Chisq Df Pr(>Chisq)
## mdl.glmmSlope       5 280.25 299.25 -135.13    270.25
```

```
## mdl.glmmSlopeDec      6 282.25 305.05 -135.13      270.25      0 1      1
```

The model comparisons show that the model with both random intercepts and random slopes is improving the model fit. The `Is.Singular` message tells us that there is a chance there is a complete separation in the model.

## 10.79168
```

3.4.1.5.5 LogOdds to proportions If you want to talk about the percentage “accuracy” of our model, then we can transform our logodds into proportions. This shows that the proportion of “grammatical” receiving a “yes” response increases by 99% (or 95% based on our “true” coefficients).

```
plogis(fixef(mdl.glmmSlope)[1])

## (Intercept)
## 0.3110795

plogis(fixef(mdl.glmmSlope)[1] + fixef(mdl.glmmSlope)[2])

## (Intercept)
## 0.9151944
```

```
grammatical2 <- grammatical2 %>%
  mutate(prob = predict(mdl.glmmSlope, type = "response"))
grammatical2 %>%
  ggplot(aes(x = as.numeric(grammaticality), y = prob)) +
  geom_point() +
  geom_smooth(method = "glm",
    method.args = list(family = "binomial"),
    se = T) + theme_bw(base_size = 20) +
  labs(y = "Probability", x = "") +
  coord_cartesian(ylim = c(0,1)) +
  scale_x_discrete(limits = c("Ungrammatical", "Grammatical")) +
  facet_grid(~ participant, margins = TRUE, scales = "free")
```

3.4.1.5.6 Plotting

3.4.2 GLMM - Numeric predictors

In this example, we will run a GLM model using a similar technique to that used in Al-Tamimi (2017) and Baumann & Winter (2018). We use the package `LanguageR` and the dataset `English`.

In the model above, we used the equation as `lm(RTlexdec ~ AgeSubject)`. We were interested in examining the impact of age of subject on reaction time in a lexical decision task. In this section, we are interested in understanding how reaction time allows to differentiate the participants based on their age. We use `AgeSubject` as our outcome and `RTlexdec` as our predictor using the equation `glm(AgeSubject ~ RTlexdec)`. We usually can use `RTlexdec` as is, but due to a possible quasi separation and the fact that we may want to compare coefficients using multiple acoustic metrics, we will z-score our predictor. We run below two models, with and without z-scoring

For the glm model, we need to specify `family = "binomial"`.

3.4.2.1 Without z-scoring of predictor

3.4.2.1.1 Model estimation In the `english` dataset, we have a random factor: “Word”. We include it here.

```
english2 <- english %>%
  mutate(AgeSubject = factor(AgeSubject, levels = c("young", "old")))

mdl.glmm2 <- english2 %>%
```

```
glmer(AgeSubject ~ RTlexdec + (1|Word), data = ., family = "binomial")
summary mdl.glm2)
```

3.4.2.1.1.1 Random Intercepts

```

The model comparisons show that the model with both random intercepts and random slopes is improving the model fit. The `Is.Singular` message tells us that there is a chance there is a complete separation in the model.

3.4.2.3 Gettings results

```

3.4.2.3.4 Logodds to Odd ratios Logodds can be modified to talk about the odds of an event.

```
exp(fixef mdl.glmmSlope2)[1])
```

```
## (Intercept)
## 6.850044e-79
```

```
exp(fixef mdl.glmmSlope2)[1] + fixef mdl.glmmSlope2[2])
```

```
## (Intercept)
## 6.22596e-67
```

3.4.2.3.5 LogOdds to proportions If you want to talk about the percentage “accuracy” of our model, then we can transform our logodds into proportions. This shows that the proportion of “grammatical” receiving a “yes” response increases by 99% (or 95% based on our “true” coefficients)

```
plogis(fixef mdl.glmmSlope2)[1])
```

```
## (Intercept)
## 6.850044e-79
```

```
plogis(fixef mdl.glmmSlope2)[1] + fixef mdl.glmmSlope2[2])
```

```
## (Intercept)
## 6.22596e-67
```

```
english2 <- english2 %>%
  mutate(prob2 = predict mdl.glmmSlope2, type = "response"))
english2 %>%
  ggplot(aes(x = as.numeric(AgeSubject), y = prob2)) +
  geom_point() +
  geom_smooth(method = "glm",
    method.args = list(family = "binomial"),
```

```
se = T) + theme_bw(base_size = 20)+
labs(y = "Probability", x = "")+
coord_cartesian(ylim = c(0,1))+
scale_x_discrete(limits = c("Young", "Old"))
```

3.4.2.3.6 Plotting

The plot above shows how the two groups differ using a glmm. The results point to an overall increase in the proportion of reaction time when moving from the “Young” to the “Old” group.

Let’s use z-scoring next

3.4.2.4 With z-scoring of predictor

```
english2 <- english2 %>%
  mutate(`RTlexdec_z` = scale(RTlexdec, center = TRUE, scale = TRUE))

english2[‘RTlexdec_z’] <- as.data.frame(scale(english2$RTlexdec))
```

3.4.2.4.1 Model estimation

```
mdl.glmm3 <- english2 %>%
  glmer(AgeSubject ~ RTlexdec_z + (1|Word), data = ., family = "binomial")
summary(mdl.glmm3)
```

3.4.2.4.1.1 Random Intercepts

anova mdl.glmm3, mdl.glmmSlope3)
```

3.4.2.4.2 Model comparison

```
## Data: .
## Models:
## mdl.glmm3: AgeSubject ~ RTlexdec_z + (1 | Word)
## mdl.glmmSlope3: AgeSubject ~ RTlexdec_z + (RTlexdec_z | Word)
##              npar    AIC    BIC  logLik -2*log(L)  Chisq Df Pr(>Chisq)
## mdl.glmm3          3 3151.8 3171.1 -1572.9    3145.8
## mdl.glmmSlope3     5 3075.6 3107.7 -1532.8    3065.6 80.259  2 < 2.2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

The model comparisons show that the model with both random intercepts and random slopes is improving the model fit. The `Is.Singular` message tells us that there is a chance there is a complete separation in the model.

3.4.2.4.3 Gettings results

```

3.4.2.4.4 Plotting

```
english2 <- english2 %>%
  mutate(prob3 = predict(mdl.glmmSlope3, type = "response"))
english2 %>%
  ggplot(aes(x = as.numeric(AgeSubject), y = prob3)) +
  geom_point() +
  geom_smooth(method = "glm",
    method.args = list(family = "binomial"),
    se = T) + theme_bw(base_size = 20) +
  labs(y = "Probability", x = "") +
  coord_cartesian(ylim = c(0,1)) +
  scale_x_discrete(limits = c("Young", "Old"))
```

3.4.2.4.4.1 Normal

We obtain the exact same plots, but the model estimations are different. Let's use another type of predictions

```

z_vals <- seq(-3, 3, 0.01)
n = nrow(english2)

dfPredNew <- data.frame(RTlexdec_z = z_vals)

### store the predicted probabilities for each value of RTlexdec_z
pp <- cbind(dfPredNew, prob = predict(mdl.glmmSlope3, newdata = dfPredNew, type = "resp"))

pp %>%
  ggplot(aes(x = RTlexdec_z, y = prob)) +
  geom_point() +
  theme_bw(base_size = 20) +
  labs(y = "Probability", x = "") +
  coord_cartesian(ylim = c(-0.1, 1.1), expand = FALSE) +
  scale_y_continuous(breaks = c(0,1), labels = c("Young", "Old")) +
  scale_x_continuous(breaks = c(-3, -2, -1, 0, 1, 2, 3))

```

3.4.2.4.4.2 z-scores

We obtain the exact same plots, but the model estimations are different.

3.5 Cumulative Logit Link Mixed-effects Models

These models work perfectly with rating data. Ratings are inherently ordered, 1, 2, ... n, and expect to observe an increase (or decrease) in overall ratings from 1 to n. To demonstrate this, we will use an example using the package “ordinal”.

We use two datasets. We previously ran these two models, however, in this subset of the full dataset, we did not take into account the fact that there were multiple producing speakers and items.

3.5.1 Ratings of percept of nasality

The first comes from a likert-scale a rating experiment where six participants rated the percept of nasality in the production of particular consonants in Arabic. The data came from nine producing subjects. The ratings were from 1 to 5, with 1 reflecting an oral percept; 5 a nasal percept.

3.5.1.1 Importing and pre-processing

We start by importing the data and process it. We change the reference level in the predictor

```
rating <- read_csv("data/rating.csv")[-1]
rating

## # A tibble: 405 x 5
##   Response Context   Subject Item   Rater
##   <dbl> <chr>      <chr>   <chr>   <chr>
## 1      2 n-3      p04     noo3-w  R01
## 2      4 isolation p04     noo3-v  R01
## 3      2 o-3      p04     djuu3-w R01
## 4      4 isolation p04     djuu3-v R01
## 5      3 n-7      p04     nuu7-w  R01
## 6      3 isolation p04     nuu7-v  R01
## 7      1 3--3     p04     3oo3-w  R01
## 8      2 isolation p04     3oo3-v  R01
## 9      2 o-7      p04     loo7-w  R01
## 10     1 o-3      p04     bii3-w  R01
## # i 395 more rows

rating <- rating %>%
  mutate(Response = factor(Response),
         Context = factor(Context),
         Subject = factor(Subject),
         Item = factor(Item)) %>%
  mutate(Context = relevel(Context, "isolation"))
rating %>%
  head(10)

```

3.5.1.3 Testing significance

We can evaluate whether “Context” improves the model fit, by comparing a null model with our model. Of course “Context” is improving the model fit.

```
mdl.clm.Null <- rating %>%
  clm(Response ~ 1, data = .)
```

```
anova(mdl.clm, mdl.clm.Null)
```

3.5.1.3.1 Null vs no random

```
## Likelihood ratio tests of cumulative link models:
##
##          formula:          link: threshold:
## mdl.clm.Null Response ~ 1      logit flexible
## mdl.clm      Response ~ Context logit flexible
##
##          no.par    AIC  logLik LR.stat df Pr(>Chisq)
## mdl.clm.Null      4 1281.1 -636.56
## mdl.clm           17 1086.3 -526.16   220.8 13 < 2.2e-16 ***
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
anova(mdl.clm, mdl.clmm.Int)
```

3.5.1.3.2 No random vs Random Intercepts

```
## Likelihood ratio tests of cumulative link models:
##
##          formula:          link: threshold:
## mdl.clm      Response ~ Context      logit flexible
## mdl.clmm.Int Response ~ Context + (1 | Subject) + (1 | Item) logit flexible
##
##          no.par    AIC  logLik LR.stat df Pr(>Chisq)
## mdl.clm           17 1086.3 -526.16
## mdl.clmm.Int      19 1079.8 -520.89  10.525 2  0.005182 **
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
```

```
anova(mdl.clmm.Int, mdl.clmm.Slope)
```

3.5.1.3.3 No random vs Random Intercepts

```
## Likelihood ratio tests of cumulative link models:
```

```
##
##          formula:                                link:
## mdl.clmm.Int   Response ~ Context + (1 | Subject) + (1 | Item)      logit
## mdl.clmm.Slope Response ~ Context + (Context | Subject) + (1 | Item) logit
##          threshold:
## mdl.clmm.Int   flexible
## mdl.clmm.Slope flexible
##
##          no.par    AIC  logLik LR.stat  df Pr(>Chisq)
## mdl.clmm.Int      19 1079.8 -520.89
## mdl.clmm.Slope    123 1231.1 -492.53  56.737 104      1
```

The model comparison above shows that using random intercepts is enough in our case. By subject Random Slopes are not needed; subjects “seem” to show similarities in how they produced the items. In our publication, by Rater Random Slopes for context were needed.

3.5.1.4 Model’s fit

```
print(tab_model(mdl.clmm.Int, file = paste0("outputs/mdl.clmm.Int.html")))
htmltools::includeHTML("outputs/mdl.clmm.Int.html")
```

3.5.1.5 Interpreting a cumulative model

As a way to interpret the model, we can look at the coefficients and make sense of the results. A CLM model is a Logistic model with a cumulative effect. The “Coefficients” are the estimates for each level of the fixed effect; the “Threshold coefficients” are those of the response. For the former, a negative coefficient indicates a negative association with the response; and a positive is positively associated with the response. The p values are indicating the significance of each level. For the “Threshold coefficients”, we can see the cumulative effects of ratings 1|2, 2|3, 3|4 and 4|5 which indicate an overall increase in the ratings from 1 to 5.

3.5.1.6 Plotting

3.5.1.6.1 No confidence intervals We use a modified version of a plotting function that allows us to visualise the effects. For this, we use the base R plotting functions. The version below is without confidence intervals.

```
par(oma=c(1, 0, 0, 3),mgp=c(2, 1, 0))
xlimNas = c(min(mdl.clmm.Int$beta), max(mdl.clmm.Int$beta))
ylimNas = c(0,1)
plot(0,0,xlim=xlimNas, ylim=ylimNas, type="n", ylab=expression(Probability), xlab="", xaxt = "n",
axis(side = 1, at = c(0,mdl.clmm.Int$beta),labels = levels(rating$Context), las=2,cex=2,cex.lab=1)
xsNas = seq(xlimNas[1], xlimNas[2], length.out=100)
lines(xsNas, plogis(mdl.clmm.Int$Theta[1] - xsNas), col='black')
```

```

lines(xsNas, plogis(mdl.clmm.Int$Theta[2] - xsNas)-plogis(mdl.clmm.Int$Theta[1] - xsNas)
lines(xsNas, plogis(mdl.clmm.Int$Theta[3] - xsNas)-plogis(mdl.clmm.Int$Theta[2] - xsNas)
lines(xsNas, plogis(mdl.clmm.Int$Theta[4] - xsNas)-plogis(mdl.clmm.Int$Theta[3] - xsNas)
lines(xsNas, 1-(plogis(mdl.clmm.Int$Theta[4] - xsNas)), col='blue')
abline(v=c(0,mdl.clmm.Int$beta),lty=3)
abline(h=0, lty="dashed")
abline(h=0.2, lty="dashed")
abline(h=0.4, lty="dashed")
abline(h=0.6, lty="dashed")
abline(h=0.8, lty="dashed")
abline(h=1, lty="dashed")

legend(par('usr')[2], par('usr')[4], bty='n', xpd=NA,lty=1, col=c("black", "red", "green", "blue"),
       legend=c("Oral", "2", "3", "4", "Nasal"),cex=0.75)

```

Predicted curves – Nasalisation

3.5.1.6.2 With confidence intervals Here is an attempt to add the 97.5% confidence intervals to these plots. This is an experimental attempt and any feedback is welcome!

```

par(oma=c(1, 0, 0, 3),mgp=c(2, 1, 0))
xlimNas = c(min(mdl.clmm.Int$beta), max(mdl.clmm.Int$beta))
ylimNas = c(0,1)
plot(0,0,xlim=xlimNas, ylim=ylimNas, type="n", ylab=expression(Probability), xlab="",
     axis(side = 1, at = c(0,mdl.clmm.Int$beta),labels = levels(rating$Context), las=2,cex=2),
     xsNas = seq(xlimNas[1], xlimNas[2], length.out=100)

```

```

Check if the results are different between our initial model (with `clm`) and our new model (with `clmm`).

3.5.2 Subjective estimates of the weight of the referents of 81 English nouns.

This dataset comes from the `LanguageR` package. It contains the subjective estimates of the weight of the referents of 81 English nouns. This dataset is a little complex. Data comes from multiple subjects who rated 81 nouns. The nouns are from a class of animals and plants. The subjects are either males or females.

We can model it in various ways. Here we decided to explore whether the ratings given to a particular word are different, when the class is either animal or a plant and if males rated the nouns differently from males. We will only use subject as a random effect. We also model the contribution of frequency.

3.5.2.1 Importing and pre-processing

```
weightRatings <- weightRatings %>%
  mutate(Rating = factor(Rating),
         Subject = factor(Subject),
         Sex = factor(Sex),
         Word = factor(Word),
         Class = factor(Class))
weightRatings %>%
  head(10)
```

##	Subject	Rating	Trial	Sex	Word	Frequency	Class
## 1	A1	5	1	F	horse	7.771910	animal
## 2	A1	1	2	F	gherkin	2.079442	plant
## 3	A1	3	3	F	hedgehog	3.637586	animal
## 4	A1	1	4	F	bee	5.700444	animal
## 5	A1	1	5	F	peanut	4.595120	plant
## 6	A1	2	6	F	pear	4.727388	plant
## 7	A1	3	7	F	pineapple	3.988984	plant
## 8	A1	2	8	F	frog	5.129899	animal
## 9	A1	1	9	F	blackberry	4.060443	plant
## 10	A1	3	10	F	pigeon	5.262690	animal

3.5.2.2 Model specifications

3.5.2.2.1 No random effects We run our first clm model as a simple, i.e., with no random effects

```

```

The model comparison above shows that using random intercepts is enough in our case. By subject Random Slopes are not needed; subjects “seem” to show similarities in how they produced the items.

3.5.2.4 Model’s fit

```
print(tab_model(mdl.clmm.Slope.1, file = paste0("outputs/mdl.clmm.Slope.1.html")))
htmltools::includeHTML("outputs/mdl.clmm.Slope.1.html")
```

3.5.2.5 Interpreting a cumulative model

As a way to interpret the model, we can look at the coefficients and make sense of the results. A CLM model is a Logistic model with a cumulative effect. The “Coefficients” are the estimates for each level of the fixed effect; the “Threshold coefficients” are those of the response. For the former, a negative coefficient indicates a negative association with the response; and a positive is positively associated with the response. The p values are indicating the significance of each level. For the “Threshold coefficients”, we can see the cumulative effects

of ratings 1|2, 2|3, 3|4 and 4|5 which indicate an overall increase in the ratings from 1 to 5.

3.5.2.6 Plotting

3.5.2.6.1 No confidence intervals We use a modified version of a plotting function that allows us to visualise the effects. For this, we use the base R plotting functions. The version below is without confidence intervals.

```
par(oma = c(4, 0, 0, 3), mgp = c(2, 1, 0))
xlim = c(min mdl.clmm.Slope.1$beta, max(mdl.clmm.Slope.1$beta))
ylim = c(0, 1)
plot(0, 0, xlim = xlim, ylim = ylim, type = "n", ylab = expression(Probability), xlab =
axis(side = 1, at = mdl.clmm.Slope.1$beta, labels = names(mdl.clmm.Slope.1$beta), las =
xs = seq(xlim[1], xlim[2], length.out = 100)
lines(xs, plogis(mdl.clmm.Slope.1$Theta[1] - xs), col = 'black')
lines(xs, plogis(mdl.clmm.Slope.1$Theta[2] - xs) - plogis(mdl.clmm.Slope.1$Theta[1] - xs), col = 'red')
lines(xs, plogis(mdl.clmm.Slope.1$Theta[3] - xs) - plogis(mdl.clmm.Slope.1$Theta[2] - xs), col = 'green')
lines(xs, plogis(mdl.clmm.Slope.1$Theta[4] - xs) - plogis(mdl.clmm.Slope.1$Theta[3] - xs), col = 'orange')

```

Check if the results are different between our initial model (with `clm`) and our new model (with `clmm`).

3.6 Generalised Additive Mixed-effects Models (GAMMs)

Generalised Additive Mixed-effects Models (GAMMs) are currently used for dynamic data. By dynamic data we mean, where the “time” component is accounted for. These can be vowel formants or f_0 obtained at 11 intervals; dynamic tongue contours obtained at multiple time points, etc.

We first use GAMMs (with random effects) to demonstrate its usage

3.6.1 Loading dataframe

```
dynamicDF <- read_csv("data/dynamicData.csv")
dynamicDF %>%
```

```
head(10)
```

```
## # A tibble: 10 x 19
##   Speaker Sex   Word repetition context vowel Label Duration F2_01 F2_02 F2_03
##   <chr>   <chr> <chr> <chr>      <chr>   <chr> <chr>   <dbl> <dbl> <dbl>
## 1 SP01    Male 2aat~ rep01    Plain   a:     V2     176. 1500. 1526.
## 2 SP01    Male 2aat~ rep02    Plain   a:     V2     143. 1518. 1520.
## 3 SP01    Male 2aat~ rep03    Plain   a:     V2     108. 1539. 1553.
## 4 SP01    Male 2aaT~ rep01    Pharyn~ a:     V2     145. 1046. 1107.
## 5 SP01    Male 2aaT~ rep02    Pharyn~ a:     V2     141. 1229. 1242.
## 6 SP01    Male 2aaT~ rep03    Pharyn~ a:     V2     108. 1156. 1165.
## 7 SP01    Male 2iit~ rep01    Plain   i:     V2     184. 2269. 2244.
## 8 SP01    Male 2iit~ rep02    Plain   i:     V2     192. 2218. 2197.
## 9 SP01    Male 2iit~ rep03    Plain   i:     V2     172. 2140. 2152.
## 10 SP01   Male 2iit~ rep01    Pharyn~ i:     V2     212. 1337. 1442.
## # i 8 more variables: F2_04 <dbl>, F2_05 <dbl>, F2_06 <dbl>, F2_07 <dbl>,
## #   F2_08 <dbl>, F2_09 <dbl>, F2_10 <dbl>, F2_11 <dbl>
```

The dataframe was extracted from a Praat script and comes in a wide format. For it to work properly with GAMMs, we convert it to a long format

3.6.2 Manipulation

3.6.2.1 Wide to Long format

```
dynamicDF <- dynamicDF %>%
  pivot_longer(-c(1:8),
    names_sep = "_",
    names_to = c("Correlate", "Interval"),
    values_to = "Vals",
    names_repair = "minimal") %>%
  pivot_wider(names_from = "Correlate",
    values_from = "Vals") %>%
  unnest()
dynamicDF %>%
  head(10)
```

```
## # A tibble: 10 x 10
##   Speaker Sex   Word repetition context vowel Label Duration Interval    F2
##   <chr>   <chr> <chr> <chr>      <chr>   <chr> <chr>   <dbl> <chr>   <dbl>
## 1 SP01    Male 2aataa rep01    Plain   a:     V2     176. 01     1500.
## 2 SP01    Male 2aataa rep01    Plain   a:     V2     176. 02     1526.
## 3 SP01    Male 2aataa rep01    Plain   a:     V2     176. 03     1498.
## 4 SP01    Male 2aataa rep01    Plain   a:     V2     176. 04     1462.

```

```
## 7 SP01 Male 2aataa rep01 Plain a: V2 176. 07 1419.
## 8 SP01 Male 2aataa rep01 Plain a: V2 176. 08 1411.
## 9 SP01 Male 2aataa rep01 Plain a: V2 176. 09 1401.
## 10 SP01 Male 2aataa rep01 Plain a: V2 176. 10 1428.
```

3.6.2.2 Transforming and arranging dataframe

```
dynamicDF <- dynamicDF %>%
  mutate(Speaker = as.factor(Speaker),
         Sex = as.factor(Sex),
         Word = as.factor(Word),
         repetition = as.factor(repetition),
         context = as.factor(context),
         vowel = as.factor(vowel),
         Interval = as.numeric(Interval)) %>%
  arrange(Speaker, Word, context, vowel)
dynamicDF %>%
  head(10)
```

```
## # A tibble: 10 x 10
##   Speaker Sex Word repetition context vowel Label Duration Interval F2
##   <fct> <fct> <fct> <fct> <fct> <fct> <chr> <dbl> <dbl> <dbl>
## 1 SP01 Male 2aataa rep01 Plain a: V2 176. 1 1500.
## 2 SP01 Male 2aataa rep01 Plain a: V2 176. 2 1526.
## 3 SP01 Male 2aataa rep01 Plain a: V2 176. 3 1498.
## 4 SP01 Male 2aataa rep01 Plain a: V2 176. 4 1462.
## 5 SP01 Male 2aataa rep01 Plain a: V2 176. 5 1433.
## 6 SP01 Male 2aataa rep01 Plain a: V2 176. 6 1421.
## 7 SP01 Male 2aataa rep01 Plain a: V2 176. 7 1419.
## 8 SP01 Male 2aataa rep01 Plain a: V2 176. 8 1411.
## 9 SP01 Male 2aataa rep01 Plain a: V2 176. 9 1401.
## 10 SP01 Male 2aataa rep01 Plain a: V2 176. 10 1428.
```

3.6.2.3 Ordering predictors

It is important to use an ordered predictor in GAMs. By default, GAMs provides computations similar to an ANOVA (with sum coding). Here, we use a treatment coding to allow for an increase in power. Also, we create an interaction factor; the results are to be modelled as a function of the interaction between the context and the vowel

```
dynamicDF$ContVowInt <- interaction(dynamicDF$context, dynamicDF$vowel)

dynamicDF$ContVowInt.ord <- as.ordered(dynamicDF$ContVowInt)
contrasts(dynamicDF$ContVowInt.ord) <- "contr.treatment"
```

```
dynamicDF$Sex.ord <- as.ordered(dynamicDF$Sex)
contrasts(dynamicDF$Sex.ord) <- "contr.treatment"
```

3.6.2.4 Start value for autocorrelation

Given that time series are heavily correlated, we need to account for this autocorrelation in any analyses. We add a variable “start” to indicate when the Interval == 1

```
dynamicDF$start <- dynamicDF$Interval == 1
```

3.6.3 Model specifications

3.6.3.1 No AR model

```
system.time(md1.gamm.F2.noAR <- bam(F2 ~ ContVowInt.ord * Sex.ord +
  ### 1d smooths
  s(Interval, bs = "cr", k = 11) +
  ### 1d smooths * factor
  s(Interval, bs = "cr", k = 11, by = ContVowInt.ord) +
  s(Interval, bs = "cr", k = 11, by = Sex.ord) +
  ### random smooths by speaker
  s(Interval, Word, bs = "fs", k = 11, m = 1, xt=list(bs = "tp")) +
  data = dynamicDF, discrete = TRUE, nthreads = 2))
```

3.6.3.1.1 Model estimation

```
##      user  system elapsed
##    0.79    0.56    0.78
```

```

```

```
plot_diff(mdl.gamm.F2.AR, view = "Interval", comp = list(ContVowInt.ord = c("Pharyngealised.u:", "
  xlab = "",
  col = 'red', mark.diff = TRUE, col.diff = "red",
  hide.label = TRUE, rm.ranef = TRUE)
```

```
## Summary:
## * Sex.ord : factor; set to the value(s): Female.
## * Interval : numeric predictor; with 100 values ranging from 1.000000 to 11.000000.
## * Speaker : factor; set to the value(s): SP01. (Might be canceled as random effect, check below)
## * Word : factor; set to the value(s): 2aataa. (Might be canceled as random effect, check below)
## * NOTE : The following random effects columns are canceled: s(Interval,Speaker),s(Interval,Speaker),s(Interval,Speaker)
##
```

```
##
## Interval window(s) of significant difference(s):
## 1.000000 - 10.595960
```

3.7 Other distributions

The code above was using a Linear Mixed Effects Modelling. The outcome was a numeric object. We also used it in the case of Generalised Linear Models with a Binomial distribution and a Cumulative function. In some cases (as we have seen above), we may have:

1. Count data (poisson),
2. Multi-category outcome (multinomial)

The code below gives you an idea of how to specify these models

```
### Poisson family
### lme4::glmer(outcome~predictor(s)+(1|subject)+(1|items)..., data=data, family=poisson)

### Multinomial family
### a bit complicated as there is a need to use Bayesian approaches, see e.g.,
### glmmADMB
### mixcat
### MCMCglmm
### see https://gist.github.com/casallas/8263818
```

3.8 session info

```
sessionInfo()
```

Part III

Qualitative data analysis and corpora

Chapter 4

Creating a corpus and basic manipulations

In this chapter, we will continue using R for the qualitative analyses of textual corpora.

After importing textual data, we will use various packages to create a corpus, and start manipulating it. We will use various functions to select portions of the files, transform the dataframes and segment the corpus into tokens and types. We will also use stop words and wordstemming.

4.1 Loading packages

```
## Use the code below to check if you have all required packages installed. If some are not installed
requiredPackages = c('tidyverse', 'tidytext', 'rvest', 'janeaustenr', 'proustr', 'textdata', 'gut')
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p)
  library(p,character.only = TRUE)
}
```

```
## Loading required package: tidytext
```

```
## Loading required package: rvest
```

```
##
```

```
## Attaching package: 'rvest'
```

```
## The following object is masked from 'package:readr':
```

```
##
```

```
## guess_encoding
```

```
## Loading required package: janeaustenr
```

```

## Loading required package: proustr
##
## Attaching package: 'proustr'
## The following object is masked from 'package:tidytext':
##
##     stop_words
## Loading required package: textdata
## Loading required package: gutenbergr
## Loading required package: quanteda
## Package version: 4.3.1
## Unicode version: 15.1
## ICU version: 74.1
## Parallel computing: 12 of 12 threads used.
## See https://quanteda.io for tutorials and examples.
## Loading required package: readtext
##
## Attaching package: 'readtext'
## The following object is masked from 'package:quanteda':
##
##     texts
## Loading required package: tm
## Loading required package: NLP
##
## Attaching package: 'NLP'
## The following objects are masked from 'package:quanteda':
##
##     meta, meta<-
## The following object is masked from 'package:ggplot2':
##
##     annotate
##
## Attaching package: 'tm'
## The following object is masked from 'package:quanteda':
##
##     stopwords
## Loading required package: SnowballC

```

```
## Loading required package: stopwords

##
## Attaching package: 'stopwords'

## The following object is masked from 'package:tm':
##
##      stopwords

## Loading required package: quanteda.textplots
```

There are various sources where one can easily find textual corpora. You can look [here](#) link.

This session is inspired by data manipulations from the [Quanteda Tutorials](#)

4.2 janeaustenr

4.2.0.1 Look at books

This library includes 6 books by Jane Austen

```
austen_books() %>%
  glimpse()
```

```
## Rows: 73,422
## Columns: 2
## $ text <chr> "SENSE AND SENSIBILITY", "", "by Jane Austen", "", "(1811)", "", ~
## $ book <fct> Sense & Sensibility, Sense & Sensibility, Sense & Sensibility, Se~
```

4.2.0.2 Summary

Books are named as: emma, mansfieldpark, northangerabbey, persuasion, pride-prejudice and sensesensibility

We use `summary()` to get number of characters in each

```
austen_books() %>%
  summary()
```

```
##      text                                book
## Length:73422      Sense & Sensibility:12624
## Class :character  Pride & Prejudice  :13030
## Mode  :character  Mansfield Park    :15349
##                                Emma      :16235
##                                Northanger Abbey : 7856
##                                Persuasion  : 8328
```

4.2.1 Import into Global Environment

Adding data from the first book into the Global Environment

```
data(sensesensibility)
#data(prideprejudice)
#data(mansfieldpark)
#data(emma)
#data(northangerabbey)
#data(persuasion)
```

4.2.2 Look into data

And we can get the top 60 rows from “sensesensibility”

```
sensesensibility %>%
  head(n = 60)
```

```
## [1] "SENSE AND SENSIBILITY"
## [2] ""
## [3] "by Jane Austen"

##
## text2 :
## "was large, and their residence was at Norland Park, in the c..."
##
## text3 :
## "their property, where, for many generations, they had lived ..."
##
## text4 :
## "respectable a manner as to engage the general good opinion o..."
##
## text5 :
## "surrounding acquaintance. The late owner of this estate was..."
##
## text6 :
## "man, who lived to a very advanced age, and who for many year..."
##
## [ reached max_ndoc ... 12,606 more documents ]
```

Given that we have many empty lines in this corpus, we clean it by excluding any empty line.

```
sensesensibility_corpus <- corpus_subset(sensesensibility_corpus, ntoken(sensesensibility_corpus)
```

4.2.4.1 Summary

```
summary(sensesensibility_corpus, 10)
```

```
## Corpus consisting of 10592 documents, showing 10 documents:
##
```

##	Text	Types	Tokens	Sentences
##	text1	13	13	2
##	text2	13	15	1
##	text3	12	14	1
##	text4	12	12	1
##	text5	12	12	2
##	text6	15	17	1
##	text7	14	14	2
##	text8	12	13	1
##	text9	15	15	1
##	text10	13	15	1

4.2.4.2 Accessing parts of corpus

```
ndoc(sensesensibility_corpus)
```

```
## [1] 10592
```

```
sensesensibility_corpus[[1]]
```

```
## [1] "The family of Dashwood had long been settled in Sussex. Their estate"
```

4.2.5 Basic manipulations

By default, a corpus is created based on the “documents” (= lines). We can reshape it to show “sentences” or “paragraphs”.

4.2.5.1 Sentences

```
sensesensibility_corpus_sent <- corpus_reshape(sensesensibility_corpus, to = "sentences")
sensesensibility_corpus_sent
```

4.2.5.3 Tokens

`tokens()` segments texts in a corpus into tokens (words or sentences) by word boundaries. We can remove punctuations or not

```
sensesensibility_corpus_tok <- tokens(sensesensibility_corpus)
sensesensibility_corpus_tok
```

4.2.5.3.1 With punctuations

```
## Tokens consisting of 10,592 documents.
## text1 :
## [1] "The"      "family"   "of"       "Dashwood" "had"      "long"
## [7] "been"     "settled"  "in"       "Sussex"   "."        "Their"
## [ ... and 1 more ]
##
## text2 :
## [1] "was"      "large"    ","        "and"      "their"    "residence"
## [7] "was"      "at"       "Norland"  "Park"     ","        "in"
## [ ... and 3 more ]
##
## text3 :

4.2.5.5 Keyword-in-contexts (kwic)

4.2.5.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the

pattern we are interested in (with * as a wildcard). Window used to display number of words/tokens around it.

```
sensesensibility_corpus_tok_no_punct_hus <- kwic(sensesensibility_corpus_tok_no_punct,
head(sensesensibility_corpus_tok_no_punct_hus, 10))
```

```
## Keyword-in-context with 10 matches.
## [text97, 8] to come the house was her | husband's |
## [text104, 4] any of her | husband's |
## [text158, 2] her | husband |
## [text172, 12] at all approve of what her | husband |
## [text185, 11] last request to me replied her | husband |
## [text209, 7] Why to be sure said her | husband |
## [text371, 8] Dashwood had been informed by her | husband |
## [text720, 9] John Dashwood said nothing but her | husband |
## [text763, 8] which were left her by her | husband |
## [text916, 3] which her | husband's |
##
## from the moment of his
## family but she had had no
## with as much kindness as he
## intended
## that I
## very gravely that would make
## of the solemn promise on
## civilly hoped
## had been sold soon after his
## wanted But they would have been

head(sensesensibility_corpus_tok_no_punct_phrase, 10))
```

4.2.5.5.2 Phrase

```
## Keyword-in-context with 10 matches.
## [text97, 4:5] right to come | the house |
## [text110, 9:10] the latter she would have quitted | the house |
## [text430, 8:9] had been staying several weeks in | the house |
## [text674, 4:5] dwelling and though | the house |
## [text677, 7:8] her after giving the particulars of | the house |
## [text703, 8:9] mother's intention of removing into Devonshire | The house |
## [text757, 4:5] Mrs Dashwood took | the house |
## [text773, 3:4] to prepare | the house |
## [text776, 9:10] undoubtingly on Sir John's description of | the house |
## [text802, 3:4] alone before | the house |
##
```

```
## was her husband's from the moment
## for ever had
## before he engaged
## he now offered her was merely
## and garden to come with
## too as
## for a twelvemonth it was ready
## for their mistress's arrival for as
## as to
## on the last evening of their
```

4.2.5.6 stopwords

stopwords are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are not interested in these stop_words.

tokens_remove() is an alias to tokens_select(selection = "remove")

```
sensesensibility_corpus_tok_no_punct_no_Stop <- tokens_select(sensesensibility_corpus_tok_no_punct_no_Stop, selection = "remove")
sensesensibility_corpus_tok_no_punct_no_Stop
```

```

4.2.5.7 wordstem

To be able to extract the stems of each of the given words, we use the function `tokens_wordstem`, `char_wordstem` or `dfm_wordstem`

4.2.5.7.1 Simple example Here is a simple example (obtained from the manual: type `?tokens_wordstem`)

```
txt <- c(one = "eating eater eaters eats ate",
        two = "taxing taxes taxed my tax return")
th <- tokens(txt)
tokens_wordstem(th)
```

```
## Tokens consisting of 2 documents.
## one :
## [1] "eat"    "eater" "eater" "eat"    "ate"
##
## two :
## [1] "tax"    "tax"    "tax"    "my"     "tax"    "return"
```

```
## simple example
char_wordstem(c("win", "winning", "wins", "won", "winner"))
```

```
## [1] "win"    "win"    "win"    "won"    "winner"
```

```
## example applied to a dfm
(origdfm <- dfm(tokens(txt)))
```

```
## Document-feature matrix of: 2 documents, 11 features (50.00% sparse) and 0 docvars.
##      features
## docs  eating eater eaters eats ate  taxing taxes taxed my tax
## one      1      1      1      1      1      0      0      0  0  0
## two      0      0      0      0      0      1      1      1  1  1
## [ reached max_nfeat ... 1 more feature ]
```

```
dfm_wordstem(origdfm)
```

```
## Document-feature matrix of: 2 documents, 6 features (50.00% sparse) and 0 docvars.
##      features
## docs  eat eater ate tax my return
## one   2     2   1   0  0      0
## two   0     0   0   4  1      1
```

```
sensesensibility_corpus_tok_no_punct_no_Stop_stem <- tokens_wordstem(sensesensibility_
sensesensibility_corpus_tok_no_punct_no_Stop_stem
```

4.2.5.7.2 tokens_wordstem

```
## Tokens consisting of 10,592 documents.
```

```
## text1 :
## [1] "famili" "Dashwood" "settl" "Sussex" "estat"
##
## text2 :
## [1] "resid" "Norland" "Park" "centr"
##
## text3 :
## [1] "properti" "generat" "live"
##
## text4 :
## [1] "respect" "manner" "engag" "opinion"
##
## text5 :

## text6 :
## [1] "live" "advanc" "age"
##
## [ reached max_ndoc ... 10,586 more documents ]
```

4.2.5.7.3 dfm_wordstem Here we can use the `dfm` (for Document Feature Matrix) to obtain details of the wordstems used in each of the texts

```
sensesensibility_corpus_tok_no_punct_no_Stop_dfm <- dfm(sensesensibility_corpus_tok_no_punct_no_S
dfm_wordstem(sensesensibility_corpus_tok_no_punct_no_Stop_dfm)
```

```
## Document-feature matrix of: 10,592 documents, 3,732 features (99.91% sparse) and 0 docvars.
##           features
## docs      famili dashwood settl sussex estat resid norland park centr properti
## text1      1         1      1      1      1      0      0      0      0      0
## text2      0         0      0      0      0      1      1      1      1      0
## text3      0         0      0      0      0      0      0      0      0      1
## text4      0         0      0      0      0      0      0      0      0      0
## text5      0         0      0      0      1      0      0      0      0      0
## text6      0         0      0      0      0      0      0      0      0      0
## [ reached max_ndoc ... 10,586 more documents, reached max_nfeat ... 3,722 more features ]
```

4.3 proustr

4.3.0.1 Look at books

This library includes 7 books written in French

```
proust_books() %>%
  glimpse()
```

```
## Rows: 4,690
```

```
## Columns: 4
## $ text    <chr> "Longtemps, je me suis couché de bonne heure. Parfois, à peine ~
## $ book    <chr> "Du côté de chez Swann", "Du côté de chez Swann", "Du côté de c~
## $ volume  <chr> "Première partie : Combray", "Première partie : Combray", "Prem~
## $ year    <dbl> 1913, 1913, 1913, 1913, 1913, 1913, 1913, 1913, 1913, 1913, 191~
```

4.3.0.2 Summary

We use `summary()` to get number of characters in each

```
proust_books() %>%
  mutate(book = factor(book)) %>%
  summary()
```

```
##      text                                     book
## Length:4690   À l'ombre des jeunes filles en fleurs: 792
## Class :character   Albertine disparue           : 259
## Mode :character   Du côté de chez Swann         :1004
##                                     La Prisonnière           : 365
##                                     Le Côté de Guermantes      :1610
##                                     Le Temps retrouvé         : 248
##                                     Sodome et Gomorrhe         : 412
##      volume      year
## Length:4690   Min.   :1913
## Class :character   1st Qu.:1919
## Mode :character   Median :1921
##                                     Mean   :1919
##                                     3rd Qu.:1921
##                                     Max.   :1927
##                                     NA's   :159
```

4.3.1 Import into Global Environment

Adding data from the first book into the Global environment

```
data(ducotedechezswann)
#data(alombredesjeunesfillesenfleurs)
#data(lecotedeguermantes)
#data(sodomeetgomorrhe)
#data(laprisonniere)
#data(albertinedisparue)
#data(letempretrouve)
```

4.3.2 Look into data

And we can get the top 60 rows from the first one

```
ducotedechezswann %>%
  head(n = 60)
```

```
## # A tibble: 60 x 4
##   text                                     book volume year

4.3.4.4 Types

We can also generate `types` on the tokenised corpus (without punctuations)

```
ducotedechezswann_corpus_types <- types(ducotedechezswann_corpus_tok_no_punct)
ducotedechezswann_corpus_types
```

```
## [1] "Longtemps" "je"
```

4.3.4.5 Keyword-in-contexts (kwic)

4.3.4.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the pattern we are interested in (with `*` as a wildcard). Window used to display number of words/tokens around it.

```
ducotedechezswann_corpus_tok_no_punct_hus <- kwic(ducotedechezswann_corpus_tok_no_punct, pattern
head(ducotedechezswann_corpus_tok_no_punct_hus, 10)
```

```
## Keyword-in-context with 10 matches.
```

```
##      [text5, 2]                                Un | homme |
##      [text14, 324]                            mari de boire du cognac déjà | homme |
##      [text16, 150]                            des meilleurs amis de son père | homme |
##      [text17, 95]                             du prince de Galles un des | hommes |
##      [text18, 162] connaissait d'autres c'étaient relations de jeune | homme |
##      [text18, 358]                            au point de vue intellectuel d'un | homme |
##      [text25, 36]                             père et l'oncle avaient été les | hommes |
##      [text27, 1296] choses mondaines ce dédain qu'affectent certains | hommes |
```

```

```
## Keyword-in-context with 10 matches.
## [text5, 1:2] | Un homme |
## [text82, 216:217] nous avons rencontré près du Pont-Vieux | un homme |
## [text82, 224:225] que mon grand-père ne connaissait pas | Un homme |
## [text82, 268:269] rencontré près du Pont-Vieux mon oncle | un homme |
## [text82, 316:317] me disait que vous aviez rencontré | un homme |
## [text198, 465:466] les femmes qui prétendent ne juger | un homme |
## [text224, 99:100] votre mort on fasse de vous | un homme |
## [text298, 175:176] de raisons pour aimer Mais pour | un homme |
## [text431, 108:109] eut besoin d'elle il était comme | un homme |
## [text449, 15:16] cela serait assez triste mais enfin | un homme |
##
## qui dort tient en cercle autour
## que mon grand-père ne connaissait pas
## que grand-père ne connaissait point s'écriait
## que vous ne connaissiez point Mais
## que vous ne connaissiez point Et
## que sur son physique voient en
## Monsieur le Curé a toujours le
## comme M Vinteuil il devait entrer
## dans la vie de qui une
## de génie peut être le cousin
```

4.3.4.6 stopwords

`stopwords` are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are

not interested in these stop_words.

tokens_remove() is an alias to tokens_select(selection = "remove")

```
ducotedechezswann_corpus_tok_no_punct_no_Stop <- tokens_select(ducotedechezswann_corpus_tok_no_punct_no_Stop)
ducotedechezswann_corpus_tok_no_punct_no_Stop
```

```
## Tokens consisting of 1,004 documents and 3 docvars.

4.4 Inaugural Corpus USA

The readtext package comes with various datasets. We specify the path to where to find the datasets and upload them

```
Data_Dir <- system.file("extdata/", package = "readtext")
```

4.4.1 Importing data

```
dat_inaug <- read.csv(paste0(Data_Dir, "/csv/inaugCorpus.csv"))
```

```
dat_inaug %>%
  str()
```

4.4.1.0.1 Checking structure

```
## 'data.frame':    5 obs. of  4 variables:
## $ texts      : chr  "Fellow-Citizens of the Senate and of the House of Representatives:\n\nAmor
## $ Year       : int  1789 1793 1797 1801 1805
## $ President: chr  "Washington" "Washington" "Adams" "Jefferson" ...
## $ FirstName: chr  "George" "George" "John" "Thomas" ...
```

```
dat_inaug %>%
  unnest()
```

4.4.1.0.2 Unnest

```
## Warning: `cols` is now required when using `unnest()`.
## i Please use `cols = c()`.
```

	texts	Year	President	FirstName
	<chr>	<int>	<chr>	<chr>
## 1	"Fellow-Citizens of the Senate and of the House of ~	1789	Washingt~	George
## 2	"Fellow citizens, I am again called upon by the voi~	1793	Washingt~	George
## 3	"When it was first perceived, in early times, that ~	1797	Adams	John
## 4	"Friends and Fellow Citizens:\n\nCalled upon to und~	1801	Jefferson	Thomas
## 5	"Proceeding, fellow citizens, to that qualification~	1805	Jefferson	Thomas

4.4.2 Create a corpus

```
dat_inaug_corpus <- corpus(dat_inaug, text_field = "texts")
print(dat_inaug_corpus)
```

```
## Corpus consisting of 5 documents and 3 docvars.
## text1 :
## "Fellow-Citizens of the Senate and of the House of Representa..."
##
## text2 :
## "Fellow citizens, I am again called upon by the voice of my c..."
##
## text3 :
## "When it was first perceived, in early times, that no middle ..."
##
## text4 :
## "Friends and Fellow Citizens: Called upon to undertake the du..."
##
## text5 :
## "Proceeding, fellow citizens, to that qualification which the..."
```

4.4.2.1 Summary

```
summary(dat_inaug_corpus, 10)
```

```
## Corpus consisting of 5 documents, showing 5 documents:
##
##   Text Types Tokens Sentences Year  President FirstName
## text1   625   1538         23 1789 Washington   George
## text2    96    147          4 1793 Washington   George
## text3   826   2578         37 1797      Adams     John
## text4   717   1927         41 1801  Jefferson   Thomas
## text5   804   2381         45 1805  Jefferson   Thomas
```

4.4.2.2 Editing docnames

```
docid <- paste(dat_inaug$Year,
               dat_inaug$FirstName,
               dat_inaug$President, sep = " ")
docnames(dat_inaug_corpus) <- docid
print(dat_inaug_corpus)

## Corpus consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## "Fellow-Citizens of the Senate and of the House of Representa..."
##
## 1793 George Washington :
## "Fellow citizens, I am again called upon by the voice of my c..."
##
## 1797 John Adams :
## "When it was first perceived, in early times, that no middle ..."
##
## 1801 Thomas Jefferson :
## "Friends and Fellow Citizens: Called upon to undertake the du..."
##
## 1805 Thomas Jefferson :
## "Proceeding, fellow citizens, to that qualification which the..."
```

4.4.2.3 Accessing parts of corpus

```
dat_inaug_corpus[[1]]

## [1] "Fellow-Citizens of the Senate and of the House of Representatives:\n\nAmong the vicissitu
dat_inaug_corpus[["1789 George Washington"]]

## [1] "Fellow-Citizens of the Senate and of the House of Representatives:\n\nAmong the vicissitu
```

4.4.2.4 Document-level information

```
head(docvars(dat_inaug_corpus))

##   Year President FirstName
## 1 1789 Washington   George
## 2 1793 Washington   George
## 3 1797      Adams     John
## 4 1801  Jefferson   Thomas
## 5 1805  Jefferson   Thomas
```

4.4.2.5 Unique variable names (for volume)

```
unique(docvars(dat_inaug_corpus, field = "Year"))
```

```
## [1] 1789 1793 1797 1801 1805
```

4.4.3 Basic manipulations

By default, a corpus is created based on the “documents” (= lines). We can reshape it to show “sentences” or “paragraphs”.

4.4.3.1 Sentences

```
dat_inaug_corpus_sent <- corpus_reshape(dat_inaug_corpus, to = "sentences")
dat_inaug_corpus_sent
```

4.4.3.1.1 Transform

```
## Corpus consisting of 150 documents and 3 docvars.
## 1789 George Washington.1 :
## "Fellow-Citizens of the Senate and of the House of Representa..."
##
## 1789 George Washington.2 :
## "On the one hand, I was summoned by my Country, whose voice I..."
##
## 1789 George Washington.3 :
## "On the other hand, the magnitude and difficulty of the trust..."
##
## 1789 George Washington.4 :
## "In this conflict of emotions all I dare aver is that it has ..."
##
## 1789 George Washington.5 :
## "All I dare hope is that if, in executing this task, I have b..."
##
## 1789 George Washington.6 :

4.4.3.3 Tokens

`tokens()` segments texts in a corpus into tokens (words or sentences) by word boundaries. We can remove punctuations or not

```
dat_inaug_corpus_tok <- tokens(dat_inaug_corpus)
dat_inaug_corpus_tok
```

4.4.3.3.1 With punctuations

```
## Tokens consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## [1] "Fellow-Citizens" "of" "the" "Senate"
## [5] "and" "of" "the" "House"
## [9] "of" "Representatives" ":" "Among"
## [ ... and 1,526 more ]
##
```

```
## 1793 George Washington :
## [1] "Fellow" "citizens" ",," "I" "am" "again"
## [7] "called" "upon" "by" "the" "voice" "of"
## [ ... and 135 more ]
##
## 1797 John Adams :
## [1] "When" "it" "was" "first" "perceived" ",,"
## [7] "in" "early" "times" ",," "that" "no"
## [ ... and 2,566 more ]
##
## 1801 Thomas Jefferson :
## [1] "Friends" "and" "Fellow" "Citizens" ":" "Called"
## [7] "upon" "to" "undertake" "the" "duties" "of"
## [ ... and 1,915 more ]
##
## 1805 Thomas Jefferson :
## [1] "Proceeding" ",," "fellow" "citizens"
## [5] ",," "to" "that" "qualification"
## [9] "which" "the" "Constitution" "requires"
## [ ... and 2,369 more ]
```

```
dat_inaug_corpus_tok_no_punct <- tokens(dat_inaug_corpus, remove_punct = TRUE)
dat_inaug_corpus_tok_no_punct
```

4.4.3.3.2 Without punctuations

```
## Tokens consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## [1] "Fellow-Citizens" "of" "the" "Senate"
## [5] "and" "of" "the" "House"
## [9] "of" "Representatives" "Among" "the"
## [ ... and 1,418 more ]
##
## 1793 George Washington :
## [1] "Fellow" "citizens" "I" "am" "again" "called"
## [7] "upon" "by" "the" "voice" "of" "my"
## [ ... and 123 more ]
##
## 1797 John Adams :
## [1] "When" "it" "was" "first" "perceived" "in"
## [7] "early" "times" "that" "no" "middle" "course"
## [ ... and 2,306 more ]
##
## 1801 Thomas Jefferson :
## [1] "Friends" "and" "Fellow" "Citizens" "Called" "upon"
```

```
## [7] "to"          "undertake" "the"          "duties"      "of"          "the"
## [ ... and 1,714 more ]
##
## 1805 Thomas Jefferson :
## [1] "Proceeding" "fellow"      "citizens"     "to"
## [5] "that"        "qualification" "which"        "the"
## [9] "Constitution" "requires"    "before"       "my"
## [ ... and 2,154 more ]
```

4.4.3.4 Types

We can also generate `types` on the tokenised corpus (without punctuations)

```
dat_inaug_corpus_tok_no_punct_types <- types(dat_inaug_corpus_tok_no_punct)
dat_inaug_corpus_tok_no_punct_types
```

```
## [1] "Fellow-Citizens" "of"          "the"
## [4] "Senate"          "and"         "House"
## [7] "Representatives" "Among"       "vicissitudes"
## [10] "incident"        "to"          "life"
## [13] "no"              "event"       "could"
## [16] "have"            "filled"      "me"
## [19] "with"            "greater"     "anxieties"
## [22] "than"            "that"        "which"

4.4.3.5 Keyword-in-contexts (kwic)

4.4.3.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the pattern we are interested in (with `*` as a wildcard). `Window` used to display number of words/tokens around it.

```
dat_inaug_corpus_tok_no_punct_hus <- kwic(dat_inaug_corpus_tok_no_punct, pattern = "pres*", window = 10)
head(dat_inaug_corpus_tok_no_punct_hus, 10)
```

```
## Keyword-in-context with 10 matches.
##      [1789 George Washington, 45]                on the 14th day of the |
##      [1789 George Washington, 343]            the public summons repaired to the |

```

4.4.3.6 stopwords

stopwords are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are not interested in these stop_words.

`tokens_remove()` is an alias to `tokens_select(selection = "remove")`

```
dat_inaug_corpus_tok_no_punct_no_Stop <- tokens_select(dat_inaug_corpus_tok_no_punct,
dat_inaug_corpus_tok_no_punct_no_Stop
```

```
## Tokens consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## [1] "Fellow-Citizens" "Senate"          "House"          "Representatives"
## [5] "vicissitudes"    "incident"        "life"           "event"
## [9] "filled"          "anxieties"       "notification"   "transmitted"
## [ ... and 496 more ]
##
## 1793 George Washington :
## [1] "Fellow"          "citizens"       "called"         "voice"          "country"
## [6] "execute"         "functions"      "Chief"          "Magistrate"     "occasion"
```

```
## [11] "proper"      "arrive"
## [ ... and 36 more ]
##
## 1797 John Adams :
## [1] "perceived"    "times"        "middle"        "America"       "remained"
## [6] "unlimited"     "submission"   "foreign"       "legislature"   "total"
## [11] "independence" "claims"
## [ ... and 824 more ]
##
## 1801 Thomas Jefferson :
## [1] "Friends"      "Fellow"       "Citizens"     "Called"        "undertake"     "duties"
## [7] "executive"    "office"       "country"      "avail"         "presence"      "portion"
## [ ... and 599 more ]
##
## 1805 Thomas Jefferson :
## [1] "Proceeding"   "fellow"       "citizens"     "qualification"
## [5] "Constitution" "requires"     "entrance"     "charge"
## [9] "conferred"    "duty"         "express"      "deep"
## [ ... and 747 more ]
```

4.4.3.7 wordstem

To be able to extract the stems of each of the given words, we use the function `tokens_wordstem`, `char_wordstem` or `dfm_wordstem`

```
dat_inaug_corpus_tok_no_punct_no_Stop_stem <- tokens_wordstem(dat_inaug_corpus_tok_no_punct_no_St
dat_inaug_corpus_tok_no_punct_no_Stop_stem
```

4.4.3.7.1 tokens_wordstem

```
## Tokens consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## [1] "Fellow-Citizen" "Senat"        "Hous"         "Repres"
## [5] "vicissitud"     "incid"        "life"         "event"
## [9] "fill"           "anxieti"      "notif"        "transmit"
## [ ... and 496 more ]
##
## 1793 George Washington :
## [1] "Fellow"      "citizen"     "call"        "voic"        "countri"     "execut"
## [7] "function"    "Chief"       "Magistr"     "occas"       "proper"      "arriv"
## [ ... and 36 more ]
##
## 1797 John Adams :
## [1] "perceiv"     "time"        "middl"       "America"     "remain"
## [6] "unlimit"     "submiss"     "foreign"     "legislatur"  "total"
## [11] "independ"    "claim"
```

```
## [ ... and 824 more ]
##
## 1801 Thomas Jefferson :
## [1] "Friend" "Fellow" "Citizen" "Call" "undertak" "duti"
## [7] "execut" "offic" "countri" "avail" "presenc" "portion"
## [ ... and 599 more ]
##
## 1805 Thomas Jefferson :
## [1] "Proceed" "fellow" "citizen" "qualif" "Constitut" "requir"
## [7] "entranc" "charg" "confer" "duti" "express" "deep"
## [ ... and 747 more ]
```

4.4.3.7.2 dfm_wordstem Here we can use the `dfm` (for Document Feature Matrix) to obtain details of the wordstems used in each of the texts

```
dat_inaug_corpus_tok_no_punct_no_Stop_dfm <- dfm(dat_inaug_corpus_tok_no_punct_no_Stop,
dfm_wordstem(dat_inaug_corpus_tok_no_punct_no_Stop_dfm))
```

```
## Document-feature matrix of: 5 documents, 1,227 features (69.80% sparse) and 3 docvars

```

4.5 Universal Declaration of Human Rights

We import multiple files containing the Universal Declaration of Human Rights in 13 languages. There are 13 different textfiles

4.5.1 Importing data

```
dat_udhr <- readtext(paste0(Data_Dir, "/txt/UDHR/*"),
                     docvarsfrom = "filenames",
                     docvarnames = c("document", "language"))
```

4.5.1.1 Checking structure

```
dat_udhr %>%
  str()
```

```
## Classes 'readtext' and 'data.frame': 13 obs. of 4 variables:
## $ doc_id : chr "UDHR_chinese.txt" "UDHR_czech.txt" "UDHR_danish.txt" "UDHR_english.txt" ...
## $ text : chr " \n 217A(III) 1948 12 10 "| __truncated__ "VŠEOBECNÁ DEKLARACE LIDSKÝCH PRÁV\nÚv~ UDHR
## $ document: chr "UDHR" "UDHR" "UDHR" "UDHR" ...
## $ language: chr "chinese" "czech" "danish" "english" ...
```

4.5.1.2 Unnest

```
dat_udhr %>%
  unnest()
```

```
## Warning: `cols` is now required when using `unnest()`.
## i Please use `cols = c()`.
```

```
## # A tibble: 13 x 4
##   doc_id      text      document language
##   <chr>      <chr>      <chr>      <chr>
## 1 UDHR_chinese.txt " \n 217A(III) ~ UDHR chinese
## 2 UDHR_czech.txt "VŠEOBECNÁ DEKLARACE LIDSKÝCH PRÁV\nÚv~ UDHR czech
## 3 UDHR_danish.txt "Den 10. december 1948 vedtog og offen~ UDHR danish
## 4 UDHR_english.txt "Universal Declaration of Human Rights~ UDHR english
## 5 UDHR_french.txt "Déclaration universelle des droits de~ UDHR french
## 6 UDHR_georgian.txt "FLFVBFYBC EAKT<FSF CF>JDTKSFJ LTRKFHF~ UDHR georgian
## 7 UDHR_greek.txt "OIKOTMENIKH ΔΙΑΚΗΠΤΕΗ ΓΙΑ ΤΑ ΑΝΘΡΩΠΙΝ~ UDHR greek
## 8 UDHR_hungarian.txt "Az Emberi Jogok Egyetemes Nyilatkozat~ UDHR hungari~
## 9 UDHR_icelandic.txt "Mannréttindayfirlýsing Sameinuðu þjóð~ UDHR iceland~
## 10 UDHR_irish.txt "DEARBHÚ UILE-CHOITEANN CEARTA AN DUIN~ UDHR irish
## 11 UDHR_japanese.txt " \n\n 1948.12.10 \n\n~ UDHR japanese
## 12 UDHR_russian.txt " \n ~ UDHR russian
## 13 UDHR_vietnamese.txt "7X\\zQ QJ{Q WR\u007fQ WK\u009b JL±L Y~ UDHR vietnam~
```

4.5.1.3 Additional formats

4.5.1.3.1 Converting from a PDF file This dataset comes as well in PDF formats. We can import data in a PDF format and obtain details from file name.

```
dat_udhr_PDF <- readtext(paste0(Data_Dir, "/pdf/UDHR/*.pdf"),
  docvarsfrom = "filenames",
  docvarnames = c("document", "language"),
  sep = "_")
```

4.5.1.3.1.1 Importing data

```
Encoding(dat_udhr_PDF$text)
```

4.5.1.3.1.2 Check encoding

```
## [1] "UTF-8" "UTF-8" "UTF-8" "unknown" "UTF-8" "UTF-8" "UTF-8"
## [8] "UTF-8" "UTF-8" "UTF-8" "UTF-8"
```

```
dat_udhr_PDF %>%
  str()
```

4.5.1.3.1.3 Checking structure

```
## Classes 'readtext' and 'data.frame': 11 obs. of 4 variables:
## $ doc_id : chr "UDHR_chinese.pdf" "UDHR_czech.pdf" "UDHR_danish.pdf" "UDHR_english.pdf"
## $ text : chr " \n\n 217A(III) \n1948 12 10 "| __truncat__
## $ document: chr "UDHR" "UDHR" "UDHR" "UDHR" ...
## $ language: chr "chinese" "czech" "danish" "english" ...
```

```
dat_udhr_PDF %>%
  unnest()
```

4.5.1.3.1.4 Unnest

```
## Warning: `cols` is now required when using `unnest()`.
## i Please use `cols = c()`.
```

```
## # A tibble: 11 x 4
##   doc_id      text      document language
##   <chr>      <chr>      <chr>      <chr>
## 1 UDHR_chinese.pdf " \n\n 217A(III) ~ UDHR chinese
## 2 UDHR_czech.pdf "VŠEOBECNÁ DEKLARACE LIDSKÝCH PRÁV\n\n~ UDHR czech

## 11 UDHR_vietnamese.pdf " 7X\\zQ QJ{Q WR~ UDHR vietnam~
```

4.5.1.3.2 Files with different encodings We look into data with different encoding. This is important as the type of data you will generate can be of

different encodings.

```
path_temp <- tempdir()
unzip(system.file("extdata", "data_files_encodedtexts.zip", package = "readtext"), exdir = path_t
```

4.5.1.3.2.1 Temp path

4.5.1.3.2.2 Importing data We use regular expressions to search for all files starting with “Indian_” or “UDHR_” and containing any characters, up to the ending with “.text”

```
filename <- list.files(path_temp, "~(Indian|UDHR_).*\\.txt$")
head(filename)
```

```
## [1] "IndianTreaty_English_UTF-16LE.txt" "IndianTreaty_English_UTF-8-BOM.txt"
## [3] "UDHR_Arabic_ISO-8859-6.txt"        "UDHR_Arabic_UTF-8.txt"
## [5] "UDHR_Arabic_WINDOWS-1256.txt"     "UDHR_Chinese_GB2312.txt"
```

4.5.1.3.2.3 Export encoding We use various functions to delete .txt at the end of each file name and then we split each string as a function of _ and obtain the third row in each list of item.

```
filename <- filename %>%
  str_replace(".txt$", "")
encoding <- purrr::map(str_split(filename, "_"), 3)
head(encoding)
```

```
## [[1]]
## [1] "UTF-16LE"
##
## [[2]]
## [1] "UTF-8-BOM"
##
## [[3]]
## [1] "ISO-8859-6"
##
## [[4]]
## [1] "UTF-8"
##
## [[5]]
## [1] "WINDOWS-1256"
##
## [[6]]
## [1] "GB2312"
```

We feed the encoding to `readtext()` to convert various character encodings into UTF-8.

```
dat_txt <- readtext(paste0(Data_Dir, "/data_files_encodedtexts.zip"),
  encoding = encoding,
  docvarsfrom = "filenames",
  docvarnames = c("document", "language", "input_encoding"))
```

```
dat_txt %>%
  unnest()
```

4.5.1.3.2.4 Unnest

```
## Warning: `cols` is now required when using `unnest()`.
## i Please use `cols = c()`.
```

```
## # A tibble: 36 x 5
##   doc_id          text      document language input_encoding
##   <chr>          <chr>      <chr>    <chr>    <chr>
## 1 IndianTreaty_English_UTF-16LE.txt "WHEREAS~ IndianT~ English  UTF-16LE
## 2 IndianTreaty_English_UTF-8-BOM.txt "ARTICLE~ IndianT~ English  UTF-8-BOM
## 3 UDHR_Arabic_ISO-8859-6.txt      ~ " UDHR      Arabic  ISO-8859-6
## 4 UDHR_Arabic_UTF-8.txt          ~ " UDHR      Arabic  UTF-8
## 5 UDHR_Arabic_WINDOWS-1256.txt    ~ " UDHR      Arabic  WINDOWS-1256
## 6 UDHR_Chinese_GB2312.txt        " \~ UDHR      Chinese  GB2312
## 7 UDHR_ChineseGBK.txt           " \~ UDHR      Chinese  GBK
## 8 UDHR_Chinese_UTF-8.txt         " \~ UDHR      Chinese  UTF-8
## 9 UDHR_English_UTF-16BE.txt      "Univers~ UDHR      English  UTF-16BE
## 10 UDHR_English_UTF-16LE.txt     "Univers~ UDHR      English  UTF-16LE
## # i 26 more rows
```

4.5.2 Create a corpus

We reuse the original data from text files to create a corpus.

```
dat_udhr_corpus <- corpus(dat_udhr)
print(dat_udhr_corpus)
```

```
## Corpus consisting of 13 documents and 2 docvars.
## UDHR_chinese.txt :
## "          217A(III)      1948  12  10    ..."
##
## UDHR_czech.txt :
## "VŠEOBECNÁ DEKLARACE LIDSKÝCH PRÁV Úvod U vědomí toho, že uzn..."
##
## UDHR_danish.txt :
## "Den 10. december 1948 vedtog og offentliggjorde FN's tredje g..."
##
## UDHR_english.txt :

4.5.3.3 Tokens

`tokens()` segments texts in a corpus into tokens (words or sentences) by word boundaries. We can remove punctuations or not

```
dat_udhr_corpus_tok <- tokens(dat_udhr_corpus)
dat_udhr_corpus_tok
```

4.5.3.3.1 With punctuations

```
## Tokens consisting of 13 documents and 2 docvars.
## UDHR_chinese.txt :
## [1] " " " " " " " " " " " " " " " "
## [9] " " " " " " " "
## [ ... and 2,837 more ]
##
## UDHR_czech.txt :
## [1] "VŠEOBECNÁ" "DEKLARACE" "LIDSKÝCH" "PRÁV" "Úvod" "U"
## [7] "vědomí" "toho" ", " "že" "uznání" "přirozené"
## [ ... and 1,741 more ]
##
## UDHR_danish.txt :
## [1] "Den" "10" "."
## [4] "december" "1948" "vedtog"
## [7] "og" "offentliggjorde" "FNs"
## [10] "tredie" "generalforsamling" "Verdenserklæringen"
## [ ... and 2,075 more ]
##
## UDHR_english.txt :
## [1] "Universal" "Declaration" "of" "Human" "Rights"
## [6] "Preamble" "Whereas" "recognition" "of" "the"
## [11] "inherent" "dignity"
## [ ... and 1,958 more ]
##
## UDHR_french.txt :
## [1] "Déclaration" "universelle" "des" "droits"
## [5] "de" "l'homme" "Préambule" "Considérant"
## [9] "que" "la" "reconnaissance" "de"
## [ ... and 2,176 more ]
##
## UDHR_georgian.txt :
## [1] "FLFVBFYBC" "EAKT" "<" "FSF" "CF"
## [6] ">" "JDTKSFJ" "LTRKFHFwBF" "GHTFV" "<"
## [11] "EKF" "dbyfblfy"
## [ ... and 2,753 more ]
##
```

```
## [ reached max_ndoc ... 7 more documents ]
```

```
dat_udhr_corpus_tok_no_punct <- tokens(dat_udhr_corpus, remove_punct = TRUE)
dat_udhr_corpus_tok_no_punct
```

4.5.3.3.2 Without punctuations

```
## Tokens consisting of 13 documents and 2 docvars.
## UDHR_chinese.txt :
## [1] " " " " " " " " " " " " " " " "
## [9] " " " " " " " "
## [ ... and 2,603 more ]
##
## UDHR_czech.txt :
## [1] "VŠEOBECNÁ" "DEKLARACE" "LIDSKÝCH" "PRÁV" "Úvod"
## [6] "U" "vědomí" "toho" "že" "uznání"
## [11] "přirozené" "důstojnosti"
## [ ... and 1,519 more ]
##
## UDHR_danish.txt :
## [1] "Den" "10" "december"
## [4] "1948" "vedtog" "og"
## [7] "offentliggjorde" "FNs" "tredie"
## [10] "generalforsamling" "Verdenserklæringen" "om"
## [ ... and 1,814 more ]
##
## UDHR_english.txt :
## [1] "Universal" "Declaration" "of" "Human" "Rights"
## [6] "Preamble" "Whereas" "recognition" "of" "the"
## [11] "inherent" "dignity"
## [ ... and 1,766 more ]
##
## UDHR_french.txt :
## [1] "Déclaration" "universelle" "des" "droits"
## [5] "de" "l'homme" "Préambule" "Considérant"
## [9] "que" "la" "reconnaissance" "de"
## [ ... and 1,962 more ]
##
## UDHR_georgian.txt :
## [1] "FLFVBFYBC" "EAKT" "<" "FSF" "CF"
## [6] ">" "JDTKSFJ" "LTRKFHFWBF" "GHTFV" "<"
## [11] "EKF" "dbyfblfy"
## [ ... and 2,023 more ]
##
## [ reached max_ndoc ... 7 more documents ]
```

4.5.3.4 Types

We can also generate `types` on the tokenised corpus (without punctuations)

```
dat_udhr_corpus_tok_no_punct_types <- types(dat_udhr_corpus_tok_no_punct)
dat_udhr_corpus_tok_no_punct_types
```

```
##      [1] " " " " " "
##      [3] " " " " " "
##      [5] " " " " " "
##      [7] " " " " " "
##      [9] " " " " " "
##     [11] " " " " " "
##     [13] "217A" "III"
##     [15] " " " "
##     [17] " " " "
##     [19] " " "1948"
##     [21] " " "12"
##     [23] " " "10"
##     [25] " " " "
##     [27] " " " "
##     [29] " " " "
##     [31] " " " "
##     [33] " " " "
##     [35] " " " "
##     [37] " " " "
##     [39] " " " "
##     [41] " " " "
##     [43] " " " "
##     [45] " " " "
##     [47] " " " "
##     [49] " " " "
##     [51] " " " "
##     [53] " " " "
##     [55] " " " "

4.5.3.5 Keyword-in-contexts (kwic)

4.5.3.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the pattern we are interested in (with `*` as a wildcard). Window used to display number of words/tokens around it.

```
dat_udhr_corpus_tok_no_punct_pond <- kwic(dat_udhr_corpus_tok_no_punct, pattern = "*pond*", window = 10)
head(dat_udhr_corpus_tok_no_punct_pond, 10)
```

4.5.3.6 stopwords

stopwords are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are not interested in these stop_words.

`tokens_remove()` is an alias to `tokens_select(selection = "remove")`

4.5.3.6.1 Single language Unfortunately, we cannot use stopwords on multilingual corpora. What you need to do is either run the stop words on each language you are interested in (by rewriting the object and changing the language's ISO name (see here))

```
dat_udhr_corpus_tok_no_punct_no_Stop <- tokens_select(dat_udhr_corpus_tok_no_punct, pa
dat_udhr_corpus_tok_no_punct_no_Stop
```

```

4.5.3.6.2 Multiple language An alternative, is following this link, to use a function that allows the mapping of the multiple languages we have, and then to use stopwords and specifying `source = "stopwords-iso"`. This allows to remove the stops words from multiple languages

```
## language assignment function
setlang <- Vectorize(
  vectorize.args = "language",
  FUN = function(language) {
    switch(language,
      "chinese" = "zh", #no stopwords defined for this language
      "czech" = "cs", #no stopwords defined for this language
      "danish" = "da",
      "english" = "en",
      "french" = "fr",
      "georgian" = "en", #we do not have Georgian in the list of languages with stopwords!
      "greek" = "el", #no stopwords defined for this language
      "hungarian" = "hu",
      "icelandic" = "en", #we do not have Icelandic in the list of languages with stopwords!
      "irish" = "ga", #no stopwords defined for this language
      "japanese" = "ja", #no stopwords defined for this language
      "russian" = "ru",
      "vietnamese" = "vi" #no stopwords defined for this language
    )
  }
)
```

```

)

## set a language docvar

4.6.2.4 Unique variable names (for volume)

```
unique(docvars(dat_twitter_corpus, field = "lang"))
```

```

## [1] "en" "tl" "und" "fr" "ja" "de" "sv" "hu" "ht" "lt" "cy" "ar"
## [13] "pt" "in" "fi" "tr" "es" "hi" "fa" "it" "pl"

```

4.6.3 Basic manipulations

By default, a corpus is created based on the “documents” (= lines). We can reshape it to show “sentences” or “paragraphs”.

4.6.3.1 Sentences

```
dat_twitter_corpus_sent <- corpus_reshape(dat_twitter_corpus, to = "sentences")
dat_twitter_corpus_sent
```

4.6.3.1.1 Transform

```
## Corpus consisting of 13,091 documents and 42 docvars.

4.6.3.4 Types

We can also generate `types` on the tokenised corpus (without punctuations)

```
dat_twitter_corpus_tok_no_punct_types <- types(dat_twitter_corpus_tok_no_punct)
dat_twitter_corpus_tok_no_punct_types
```

```
## [1] "@EFC_Jayy"

4.6.3.5 Keyword-in-contexts (kwic)

4.6.3.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the pattern we are interested in (with `*` as a wildcard). `Window` used to display number of words/tokens around it.

```
dat_twitter_corpus_tok_no_punct_pres <- kwic(dat_twitter_corpus_tok_no_punct, pattern =
head(dat_twitter_corpus_tok_no_punct_pres, 10)
```

```
## Keyword-in-context with 10 matches.

```

4.6.3.6 stopwords

stopwords are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are not interested in these stop_words.

tokens_remove() is an alias to tokens_select(selection = "remove")

```
dat_twitter_corpus_tok_no_punct_no_Stop <- tokens_select(dat_twitter_corpus_tok_no_punct, pattern = stopwords)
dat_twitter_corpus_tok_no_punct_no_Stop
```

```
## Tokens consisting of 7,504 documents and 42 docvars.
## twitter.json.1 :
## [1] "@EFC_Jayy" "UKIP"
##
## twitter.json.2 :
## [1] "RT"           "@Corbynator2" "@jeremycorbyn" "Reaction"
## [5] "people"      "Watford"      "Rally"         "Jeremy"
```

```
## [9] "Corbyn"          "Jeremy"          "#GE2017"          "#GE17"
## [ ... and 2 more ]
##
## twitter.json.3 :
## [1] "RT"              "@ryvr"
## [3] "Stephen"         "Hawking"
## [5] "world's"         "smartest"
## [7] "Jeremy"          "Corbyn"

## [ reached max_ndoc ... 7,498 more documents, reached max_nfeat ... 10,861 more features]
```

We use the `rvest` package to obtain data from a specific URL. See here for advanced webscrapping. Look at this link as well for a more straightforward way.

4.7 Single web page

4.7.1 Read_html

```
web_page <- rvest::read_html("https://www.tidyverse.org/packages/")
web_page
```

```
## {html_document}
## <html>
## [1] <head>\n<meta http-equiv="Content-Type" content="text/html; charset=UTF-8 ...
## [2] <body>\n<div id="appTidyverseSite" class="shrinkHeader alwaysShrinkHeader ...
```

Because the downloaded file contains a unnecessary information. We process the data to extract only the text from the webpage.

4.7.2 Extract headline

```
header_web_page <- web_page %>%
  ## extract paragraphs
  rvest::html_nodes("h1") %>%
  ## extract text
  rvest::html_text()
head(header_web_page)

## [1] "Tidyverse packages"
```

4.7.3 Extract text

```
web_page_txt <- web_page %>%
  ## extract paragraphs
  rvest::html_nodes("p") %>%
  ## extract text
  rvest::html_text()
head(web_page_txt)
```

```
## [1] "Install all the packages in the tidyverse by running install.packages(\"tidyverse\")."
## [2] "Run library(tidyverse) to load the core tidyverse and make it available\nin your current

4.7.5.5 Keyword-in-contexts (kwic)

4.7.5.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the pattern we are interested in (with `*` as a wildcard). `Window` used to display number of words/tokens around it.

```
web_page_txt_corpus_tok_no_punct_types_tidy <- kwic(web_page_txt_corpus_tok_no_punct,
head(web_page_txt_corpus_tok_no_punct_types_tidy, 10)
```

```
## Keyword-in-context with 10 matches.
## [text1, 7] Install all the packages in the | tidyverse |
## [text1, 11] in the tidyverse by running install.packages | tidyverse |
## [text2, 3] Run library | tidyverse |
## [text2, 8] library tidyverse to load the core | tidyverse |
## [text3, 5] Learn more about the | tidyverse |
## [text4, 3] The core | tidyverse |
## [text4, 18] in everyday data analyses As of | tidyverse |
## [text4, 28] packages are included in the core | tidyverse |
## [text7, 1] | tidy |
## [text7, 12] functions that help you get to | tidy |
##
## by running install.packages tidyverse
##
## to load the core tidyverse and
## and make it available in your
## package at https://tidyverse.tidyverse.org
## includes the packages that you're likely
## 1.3.0 the following packages are included
##
## provides a set of functions that
## data Tidy data is data with
```

```
web_page_txt_corpus_tok_no_punct_phrase <- kwic(web_page_txt_corpus_tok_no_punct, patt
head(web_page_txt_corpus_tok_no_punct_phrase, 10)
```

4.7.5.5.2 Phrase

```
## Keyword-in-context with 6 matches.
## [text1, 6:7] Install all the packages in | the tidyverse |
## [text3, 4:5] Learn more about | the tidyverse |
## [text14, 1:2] | The tidyverse |
## [text15, 9:10] as readr for reading flat files | the tidyverse |
## [text28, 8:9] provides the pipe > used throughout | the tidyverse |
## [text30, 3:4] Modeling with | the tidyverse |
##
```

```
## by running install.packages tidyverse
## package at https://tidyverse.tidyverse.org
## also includes many other packages with
## package installs a number of other
## It also provide a number of
## uses the collection of tidymodels packages
```

4.7.5.6 stopwords

`stopwords` are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are not interested in these `stop_words`.

`tokens_remove()` is an alias to `tokens_select(selection = "remove")`

```
web_page_txt_corpus_tok_no_punct_no_Stop <- tokens_select(web_page_txt_corpus_tok_no_punct, patte
web_page_txt_corpus_tok_no_punct_no_Stop
```

```
## Tokens consisting of 31 documents.
## text1 :

```

4.7.5.7 wordstem

To be able to extract the stems of each of the given words, we use the function `tokens_wordstem`, `char_wordstem` or `dfm_wordstem`

```
web_page_txt_corpus_tok_no_punct_no_Stop_stem <- tokens_wordstem(web_page_txt_corpus_t
web_page_txt_corpus_tok_no_punct_no_Stop_stem
```

4.7.5.7.1 tokens_wordstem

```
## Tokens consisting of 31 documents.

```

4.7.5.7.2 dfm_wordstem Here we can use the `dfm` (for Document Feature Matrix) to obtain details of the wordstems used in each of the texts

```
web_page_txt_corpus_tok_no_punct_no_Stop_stem_dfm <- dfm(web_page_txt_corpus_tok_no_punct_no_Stop_stem_dfm)
dfm_wordstem(web_page_txt_corpus_tok_no_punct_no_Stop_stem_dfm)

##
## [[8]]
## {html_document}
## <html lang="en">
## [1] <head>\n<meta http-equiv="Content-Type" content="text/html; charset=UTF-8 ...
## [2] <body>\n    <a href="#container" class="visually-hidden-focusable">Skip t ...
##
## [[9]]
## {html_document}
## <html lang="en">
## [1] <head>\n<meta http-equiv="Content-Type" content="text/html; charset=UTF-8 ...
## [2] <body>\n    <a href="#container" class="visually-hidden-focusable">Skip t ...
```

The structure seems to be similar across all pages

```
pages %>%
  map(rvest::html_element, css = "a.navbar-brand") %>%
  map_chr(rvest::html_text)
```

```
## [1] "ggplot2"    "dplyr"      "tidyr"      "readr"      "purrr"      "tibble"
## [7] "stringr"    "forcats"    "lubridate"
```

and extracting version number

```
pages %>%
  map(rvest::html_element, css = "small.nav-text.text-muted.me-auto") %>%
  map_chr(rvest::html_text)
```

```
## [1] "4.0.1" "1.1.4" "1.3.1" "2.1.6" "1.2.0" "3.3.0" "1.6.0" "1.0.1" "1.9.4"
```

and we can also add all into a tibble

4.8.4 Extract text

```

pages_table <- tibble(
  name = pages %>%
    map(rvest::html_element, css = "a.navbar-brand") %>%
    map_chr(rvest::html_text),
  version = pages %>%
    map(rvest::html_element, css = "small.nav-text.text-muted.me-auto") %>%
    map_chr(rvest::html_text),
  CRAN = pages %>%
    map(rvest::html_element, css = "ul.list-unstyled > li:nth-child(1) > a") %>%
    map_chr(rvest::html_attr, name = "href"),
  Learn = pages %>%
    map(rvest::html_element, css = "ul.list-unstyled > li:nth-child(4) > a") %>%
    map_chr(rvest::html_attr, name = "href"),
  text = pages %>%
    map(rvest::html_element, css = "body") %>%
    map_chr(rvest::html_text2)
)
pages_table

```

```

## # A tibble: 9 x 5

4.8.6 Basic manipulations

By default, a corpus is created based on the “documents” (= lines). We can reshape it to show “sentences” or “paragraphs”.

4.8.6.1 Sentences

```
web_pages_txt_corpus_sent <- corpus_reshape(web_pages_txt_corpus, to = "sentences")
web_pages_txt_corpus_sent
```

4.8.6.1.1 Transform

```
## Corpus consisting of 187 documents and 4 docvars.
## text1.1 :
## "Skip to content ggplot24.0.1 Get started Reference News Rele..."
```

```
##
## text1.2 :
## "You provide the data, tell ggplot2 how to map variables to a..."
##
## text1.3 :
## "Installation # The easiest way to get ggplot2 is to install..."
##
## text1.4 :
## "However, in most cases you start with ggplot(), supply a dat..."
##
## text1.5 :
## "You then add on layers (like geom_point() or geom_histogram(...)"
##
## text1.6 :
## "That means, by-and-large, ggplot2 itself changes relatively ..."
##
## [ reached max_ndoc ... 181 more documents ]
```

4.8.6.3 Tokens

`tokens()` segments texts in a corpus into tokens (words or sentences) by word boundaries. We can remove punctuations or not

```
web_pages_txt_corpus_tok <- tokens(web_pages_txt_corpus)
web_pages_txt_corpus_tok
```

4.8.6.3.1 With punctuations

```
## Tokens consisting of 9 documents and 4 docvars.
## text1 :
## [1] "Skip"          "to"            "content"       "ggplot24.0.1" "Get"

4.8.6.5 Keyword-in-contexts (kwic)

4.8.6.5.1 Pattern You can see how keywords are used in the actual contexts in a concordance view produced by `kwic()`. `Pattern` is used to search for the pattern we are interested in (with `*` as a wildcard). `Window` used to display number of words/tokens around it.

```
web_pages_txt_corpus_tok_no_punct_types_tidy <- kwic(web_pages_txt_corpus_tok_no_punct,
head(web_pages_txt_corpus_tok_no_punct_types_tidy, 10)
```

```
## Keyword-in-context with 10 matches.
## [text1, 113] ggplot2 is to install the whole | tidyverse |

```

4.8.6.6 stopwords

`stopwords` are function words (or grammatical words). We can search for these and remove them (if not necessary). This step is often useful because we are not interested in these `stop_words`.

`tokens_remove()` is an alias to `tokens_select(selection = "remove")`

```
web_pages_txt_corpus_tok_no_punct_no_Stop <- tokens_select(web_pages_txt_corpus_tok_no_punct, pat
web_pages_txt_corpus_tok_no_punct_no_Stop
```

```
## Tokens consisting of 9 documents and 4 docvars.

Chapter 5

Advanced manipulations of corpora

In this chapter, we will continue using R for the qualitative analyses of textual corpora.

After importing textual datasets, we will look at how to manipulate these datasets. We will introduce some new notions, including kwics (key-words in context), compound words, n-grams, dictionaries, part-of-speech tagging, and feature co-occurrence matrices (FCM). We will also look at how to visualise these datasets.

5.1 Loading packages

```
## Use the code below to check if you have all required packages installed. If some are not installed
requiredPackages = c('tidyverse', 'tidytext', 'rvest', 'janeaustenr', 'proustr', 'textdata', 'gut')
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p)
  library(p,character.only = TRUE)
}
```

```
## Loading required package: udpipe
```

```
## Loading required package: textplot
```

```
## Loading required package: ggraph
```

There are various sources where one can easily find textual corpora. You can look [here](#) link.

This session is inspired by data manipulations from the [Quanteda Tutorials](#)

5.2 janeaustenr

5.2.1 Import into Global Environment

Adding data from the first book into the Global Environment

```
data(sensesensibility)
#data(prideprejudice)
#data(mansfieldpark)
#data(emma)
#data(northangerabbey)
#data(persuasion)
```

5.2.2 Look into data

And we can get the top 60 rows from “sensesensibility”

```
sensesensibility %>%

5.2.5.2 Compound words

Compound words are multi-word expressions that are relevant for our analysis. We already found these based the `kwic` function

```
sensesensibility_corpus_tok_no_punct_phrase <- kwic(sensesensibility_corpus_tok_no_punct_phrase, 10)
```

5.2.5.2.1 kwic Phrase

```
## Keyword-in-context with 10 matches.
## [text97, 4:5] right to come | the house |
## [text110, 9:10] the latter she would have quitted | the house |
## [text430, 8:9] had been staying several weeks in | the house |
## [text674, 4:5] dwelling and though | the house |
## [text677, 7:8] her after giving the particulars of | the house |
## [text703, 8:9] mother's intention of removing into Devonshire | The house |
## [text757, 4:5] Mrs Dashwood took | the house |
## [text773, 3:4] to prepare | the house |
## [text776, 9:10] undoubtingly on Sir John's description of | the house |
## [text802, 3:4] alone before | the house |
##
## was her husband's from the moment
## for ever had
## before he engaged
## he now offered her was merely
## and garden to come with
## too as
## for a twelvemonth it was ready
## for their mistress's arrival for as
## as to
```

```
## on the last evening of their
```

5.2.5.2.2 Compounds However, these are computed as individual words not compound words. To do so, we can use the following code. As you see the phrase we were interested in is now added as compound words

```
sensesensibility_corpus_tok_no_punct_comp <- tokens_compound(sensesensibility_corpus_tok_no_punct,
sensesensibility_corpus_tok_no_punct_comp_kwic <- kwic(sensesensibility_corpus_tok_no_punct_comp,
head(sensesensibility_corpus_tok_no_punct_comp_kwic, 10)
```

```
## Keyword-in-context with 10 matches.
## [text97, 4] right to come | the_house |
## [text110, 9] latter she would have quitted | the_house |
## [text430, 8] been staying several weeks in | the_house |
## [text674, 4] dwelling and though | the_house |
## [text677, 7] after giving the particulars of | the_house |
## [text703, 8] intention of removing into Devonshire | The_house |
## [text757, 4] Mrs Dashwood took | the_house |
## [text773, 3] to prepare | the_house |
## [text776, 9] on Sir John's description of | the_house |
## [text802, 3] alone before | the_house |
##
## was her husband's from the

## he now offered her was
## and garden to come with
## too as
## for a twelvemonth it was
## for their mistress's arrival for
## as to
## on the last evening of
```

5.2.5.3 N-grams

N-grams are a subfamily of compound words. They can be named as “bi-grams”, “tri-grams”, etc. N-grams yield a sequence of tokens from already tokenised text object.

5.2.5.3.1 Multi-grams The code below allows to obtain the sequences of consecutive compound words, with 2, 3 or 4 compound words.

```
sensesensibility_corpus_tok_no_punct_ngram <- tokens_ngrams(sensesensibility_corpus_tok_no_punct,
  unlist() %>%
  tolower() %>%
  table()
```

```
## Top 10 rows
```

```
head(sensesensibility_corpus_tok_no_punct_ngram, 10)
```

```
## .
##           1_ends           200_1           200_1_per
##           1             1             1
##       200_1_per_annum       70001_would       70001_would_support
##           1             1             1
## 70001_would_support_her       a-day_i       a-day_i_shall
##           1             1             1
##           a-piece_and
##           1
```

```
## Last 10 rows

5.2.5.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_sensesensibility <- dictionary(list(large = c("large", "big"),
                                         property = c("property", "house"),
                                         good = c("good", "great")))
print(dict_sensesensibility)
```

5.2.5.4.1 Create dictionary

```
## Dictionary object with 3 key entries.
## - [large]:
##   - large, big
## - [property]:
##   - property, house
## - [good]:
##   - good, great
```

```
sensesensibility_corpus_tok_no_punct_dict_toks <- tokens_lookup(sensesensibility_corpus_tok_no_punct, dict_sensesensibility)
print(sensesensibility_corpus_tok_no_punct_dict_toks)
```

5.2.5.4.2 Token lookup

```
## Tokens consisting of 10,592 documents.

5.2.5.5 Part of Speech tagging

This section borrows many features from here. Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

Overview of Penn English Treebank part-of-speech tags.

Tag	Description	Examples
CC	Coordinating conjunction	and, or, but
CD	Cardinal number	one, two, three
DT	Determiner	a, the
EX	Existential there	There/EX was a party in progress
FW	Foreign word	persona/FW non/FW grata/FW
IN	Preposition or subordinating con	uh, well, yes
JJ	Adjective	good, bad, ugly
JJR	Adjective, comparative	better, nicer
JJS	Adjective, superlative	best, nicest
LS	List item marker	a., b., 1., 2.
MD	Modal	can, would, will
NN	Noun, singular or mass	tree, chair
NNS	Noun, plural	trees, chairs
NNP	Proper noun, singular	John, Paul, CIA
NNPS	Proper noun, plural	Johns, Pauls, CIAs
PDT	Predeterminer	all/PDT this marble, many/PDT a soul
POS	Possessive ending	John/NNP 's/POS, the parentss/NNP 'POS distress
PRP	Personal pronoun	I, you, he
PRP\$	Possessive pronoun	mine, yours
RB	Adverb	evry, enough, not
RBR	Adverb, comparative	later
RBS	Adverb, superlative	latest
RP	Particle	RP
SYM	Symbol	CO2
TO	to	to
UH	Interjection	uhm, uh
VB	Verb, base form	go, walk
VBD	Verb, past tense	walked, saw
VBG	Verb, gerund or present particip	walking, seeing
VBN	Verb, past participle	walked, thought
VBP	Verb, non-3rd person singular pr	walk, think
VBZ	Verb, 3rd person singular presen	walks, thinks
WDT	Wh-determiner	which, that
WP	Wh-pronoun	what, who, whom (wh-pronoun)
WP\$	Possessive wh-pronoun	whose, who (wh-words)
WRB	Wh-adverb	how, where, why (wh-adverb)

5.2.5.5.1 Download and load language model Before using the PoS-tagger, we need to download a language model. As you can see from typing `?udpipe_download_model`, there are 65 languages trained on 101 treebanks from here

```
file_to_check <- "models/english-ewt-ud-2.5-191206.udpipe"

if (file.exists(file = file_to_check)){
  m_english <- udpipes_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}else{
  m_english <- udpipes_download_model(model_dir = "models/", language = "english-ewt")
  m_english <- udpipes_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}

sensesensibility_corpus_tok_no_punct_anndf <- udpipes_annotate(m_english, x = sensesensibility_corpus_tok_no_punct_anndf)
as.data.frame()
## inspect
head(sensesensibility_corpus_tok_no_punct_anndf, 10)
```

5.2.5.5.2 Tokenise, tag, dependency parsing

```

## que sur son physique voient
## Monsieur le Curé a toujours
## comme M Vinteuil il devait
## dans la vie de qui
## de génie peut être le
```

5.3.4.3 N-grams

N-grams are a subfamily of compound words. They can be named as “bi-grams”, “tri-grams”, etc. N-grams yield a sequence of tokens from already tokenised text object.

5.3.4.3.1 Multi-grams The code below allows to obtain the sequences of consecutive compound words, with 2, 3 or 4 compound words.

```
ducotedechezswann_corpus_tok_no_punct_ngram <- tokens_ngrams(ducotedechezswann_corpus_tok_no_punct_no_punct, 2)
unlist() %>%
tolower() %>%
table()
## Top 10 rows
head(ducotedechezswann_corpus_tok_no_punct_ngram, 10)
```

```
## .
##          il_est          il_est_très          il_est_très_tenu
##              1              1              1
##      _comment      _comment_c'est _comment_c'est_cela
##              1              1              1
##              _et              _et_la              _et_la_joie
##              1              1              1
##              _mais
##              3
```

```
## Last 10 rows
tail(ducotedechezswann_corpus_tok_no_punct_ngram, 10)
```

```
## .
## zoologiques_où_l'on Voit          zut_mais          zut_mais_en
##              1              1              1
##      zut_mais_en_même          zut_zut          zut_zut_mais
```

```
##              1              3              1
##      zut_zut_mais_en      zut_zut_zut      zut_zut_zut_mais
##              1              2              1
##      zut_zut_zut_zut
##              1
```

5.3.4.3.2 Skip-grams

Skip-grams allow to obtain non consecutive n-grams

```
ducotedechezswann_corpus_tok_no_punct_ngram_skip <- tokens_ngrams(ducotedechezswann_corpus_tok_no_punct,
  unlist() %>%
  tolower() %>%
  table()
## Top 10 rows
head(ducotedechezswann_corpus_tok_no_punct_ngram_skip, 10)
```

```
## .
##      il_tenu      il_tenu_a      il_tenu_a_femme
##      1          1          1
##      il_tenu_a_une      il_tenu_y      il_tenu_y_certainement
##      1          1          1
##      il_tenu_y_une      il_très      il_très_il
##      1          1          1
##      il_très_il_a
##      1
```

```
## Last 10 rows
tail(ducotedechezswann_corpus_tok_no_punct_ngram_skip, 10)
```

```
## .
##      zut_zut      zut_zut_en      zut_zut_en_je      zut_zut_en_temps
##      3          3          3          3
##      zut_zut_mais      zut_zut_mais_même      zut_zut_mais_temps      zut_zut_même
##      1          1          1          2
##      zut_zut_même_je      zut_zut_même_sentis
##      2          2
```

5.3.4.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_ducotedechezswann <- dictionary(list(famille = c("grand-père", "femme", "homme", "jeune", "vieille"),
  dormir = c("rendormais", "dors", "dort")))
print(dict_ducotedechezswann)
```

5.3.4.4.1 Create dictionary

```
## Dictionary object with 2 key entries.
## - [famille]:
##   - grand-père, femme, homme, oncle
## - [dormir]:
##   - rendormais, dors, dort
```

```
ducotedechezswann_corpus_tok_no_punct_dict_toks <- tokens_lookup(ducotedechezswann_corpus_tok_no_
print(ducotedechezswann_corpus_tok_no_punct_dict_toks)
```

5.3.4.4.2 Token lookup

```
## Tokens consisting of 1,004 documents and 3 docvars.
## text1 :
## character(0)
##
## text2 :
## character(0)
##
## text3 :
## [1] "dormir"
##
## text4 :
## [1] "famille" "famille" "famille"
##
## text5 :
## [1] "famille" "dormir" "dormir"
##
## text6 :
## [1] "famille"
##
## [ reached max_ndoc ... 998 more documents ]
```

```
dfm(ducotedechezswann_corpus_tok_no_punct_dict_toks)
```

5.3.4.4.3 DFM

```
## Document-feature matrix of: 1,004 documents, 2 features (91.33% sparse) and 3 docvars.
##           features
## docs    famille dormir
## text1      0      0
## text2      0      0
## text3      0      1
## text4      3      0
```

```
## text5      1      2
## text6      1      0
## [ reached max_ndoc ... 998 more documents ]
```

5.3.4.5 Part of Speech tagging

Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

5.3.4.5.1 Download and load language model Before using the PoS-tagger, we need to download a language model. As you can see from typing `?udpipe_download_model`, there are 65 languages trained on 101 treebanks from here

```
file_to_check <- "models/french-partut-ud-2.5-191206.udpipe"

if (file.exists(file = file_to_check)){
  m_french <- udpipes_load_model(file = "models/french-partut-ud-2.5-191206.udpipe")
}else{
  m_french <- udpipes_download_model(model_dir = "models/", language = "french-partut")
  m_french <- udpipes_load_model(file = "models/french-partut-ud-2.5-191206.udpipe")
}
```

5.3.4.5.2 Tokenise, tag, dependency parsing We use the already tokenised text, with no punctuations.

```
ducotedechezswann_anndf <- udpipes_annotate(m_french, x = ducotedechezswann_corpus_tok_1,
  as.data.frame())
## inspect
head(ducotedechezswann_anndf, 10)
```

5.4 Inaugural Corpus USA

The readtext package comes with various datasets. We specify the path to where to find the datasets and upload them

```
Data_Dir <- system.file("extdata/", package = "readtext")
```

5.4.1 Importing data

```
dat_inaug <- read.csv(paste0(Data_Dir, "/csv/inaugCorpus.csv"))
```

5.4.2 Create a corpus

```
dat_inaug_corpus <- corpus(dat_inaug, text_field = "texts")
print(dat_inaug_corpus)

## Corpus consisting of 5 documents and 3 docvars.
## text1 :
## "Fellow-Citizens of the Senate and of the House of Representa..."
##
## text2 :
## "Fellow citizens, I am again called upon by the voice of my c..."
##
## text3 :
## "When it was first perceived, in early times, that no middle ..."
##
## text4 :
## "Friends and Fellow Citizens: Called upon to undertake the du..."
##
## text5 :
## "Proceeding, fellow citizens, to that qualification which the..."
```

5.4.2.1 Summary

```
summary(dat_inaug_corpus, 10)

## Corpus consisting of 5 documents, showing 5 documents:
##
##   Text Types Tokens Sentences Year  President FirstName
## text1   625   1538        23 1789 Washington   George
## text2    96    147         4 1793 Washington   George
## text3   826   2578        37 1797      Adams     John
## text4   717   1927        41 1801 Jefferson   Thomas
## text5   804   2381        45 1805 Jefferson   Thomas
```

5.4.2.2 Editing docnames

```
docid <- paste(dat_inaug$Year,
               dat_inaug$FirstName,
               dat_inaug$President, sep = " ")
docnames(dat_inaug_corpus) <- docid
print(dat_inaug_corpus)

## Corpus consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## "Fellow-Citizens of the Senate and of the House of Representa..."
##
```

```
## 1793 George Washington :
## "Fellow citizens, I am again called upon by the voice of my c..."

5.4.3.3 N-grams

N-grams are a subfamily of compound words. They can be named as “bi-grams”, “tri-grams”, etc. N-grams yield a sequence of tokens from already tokenised text object.

5.4.3.3.1 Multi-grams The code below allows to obtain the sequences of consecutive compound words, with 2, 3 or 4 compound words.

```
dat_inaug_corpus_tok_no_punct_ngram <- tokens_ngrams(dat_inaug_corpus_tok_no_punct, n = 2:4) %>%
  unlist() %>%
  tolower() %>%
  table()
## Top 10 rows
head(dat_inaug_corpus_tok_no_punct_ngram, 10)
```

```
## .
##           14th_day           14th_day_of
##           1               1
##      14th_day_of_the      a_benevolent
##           1               1
##      a_benevolent_human  a_benevolent_human_mind
##           1               1
##           a_benign       a_benign_religion
##           1               1
## a_benign_religion_professed      a_bulwark
##           1               1
```

```
## Last 10 rows
tail(dat_inaug_corpus_tok_no_punct_ngram, 10)
```

```
## .
##      zeal_and_purity zeal_and_purity_and      zeal_and_wisdom      zeal_and_wisdom_of
##           1               1               1               1
##           zeal_on      zeal_on_which      zeal_on_which_to      zeal_with
##           1               1               1               1
##      zeal_with_which      zeal_with_which_it
##           1               1
```

5.4.3.3.2 Skip-grams Skip-grams allow to obtain non consecutive n-grams

```
dat_inaug_corpus_tok_no_punct_ngram_skip <- tokens_ngrams(dat_inaug_corpus_tok_no_punct, n = 2:4,
  unlist() %>%
  tolower() %>%
  table()
## Top 10 rows

5.4.3.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_dat_inaug <- dictionary(list(Population = c("Citizens*", "people"),
                                upper_house = c("Representatives", "senat")))
print(dict_dat_inaug)
```

5.4.3.4.1 Create dictionary

```
## Dictionary object with 2 key entries.
## - [Population]:
##   - citizens*, people
## - [upper_house]:
##   - representatives, senat
```

```
dat_inaug_corpus_tok_no_punct_dict_toks <- tokens_lookup(dat_inaug_corpus_tok_no_punct,
print(dat_inaug_corpus_tok_no_punct_dict_toks)
```

5.4.3.4.2 Token lookup

```
## Tokens consisting of 5 documents and 3 docvars.
## 1789 George Washington :
## [1] "upper_house" "Population" "Population" "Population" "Population"
## [6] "Population" "Population" "Population" "upper_house" "Population"
##
## 1793 George Washington :
## [1] "Population" "Population"
##
## 1797 John Adams :
## [1] "Population" "upper_house" "Population" "Population" "Population"
## [6] "Population" "upper_house" "Population" "Population" "Population"
## [11] "Population" "Population"
## [ ... and 12 more ]
##
## 1801 Thomas Jefferson :
## [1] "Population" "Population" "Population" "Population" "Population"
## [6] "Population" "Population"
##
## 1805 Thomas Jefferson :
## [1] "Population" "Population" "Population" "Population" "Population"
## [6] "Population" "Population" "Population" "Population" "Population"
```

```
dfm(dat_inaug_corpus_tok_no_punct_dict_toks)
```

5.4.3.4.3 DFM

```
## Document-feature matrix of: 5 documents, 2 features (30.00% sparse) and 3 docvars.
##

## 1805 Thomas Jefferson      10      0
```

5.4.3.5 Part of Speech tagging

Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

5.4.3.5.1 Download and load language model Before using the PoS-tagger, we need to download a language model. As you can see from typing

?udpipe_download_model, there are 65 languages trained on 101 treebanks from here

```
file_to_check <- "models/english-ewt-ud-2.5-191206.udpipe"

if (file.exists(file = file_to_check)){
  m_english <- udpipe_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}else{
  m_english <- udpipe_download_model(model_dir = "models/", language = "english-ewt")
  m_english <- udpipe_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}
```

5.4.3.5.2 Tokenise, tag, dependency parsing We use the already tokenised text, with no punctuations.

```
dat_inaug_anndf <- udpipe_annotate(m_english, x = dat_inaug_corpus_tok_no_punct[[1]])
  as.data.frame()
## inspect
head(dat_inaug_anndf, 10)
```

5.5.3.3 N-grams

N-grams are a subfamily of compound words. They can be named as “bi-grams”, “tri-grams”, etc. N-grams yield a sequence of tokens from already tokenised text object.

5.5.3.3.1 Multi-grams The code below allows to obtain the sequences of consecutive compound words, with 2, 3 or 4 compound words.

```
dat_udhr_corpus_tok_no_punct_ngram <- tokens_ngrams(dat_udhr_corpus_tok_no_punct, n = 2)
  unlist() %>%
  tolower() %>%
  table()
## Top 10 rows
head(dat_udhr_corpus_tok_no_punct_ngram, 10)
```

```
## .
##           #_8_fv          #_8_fv_ltrkfhfwbfib
##           1              1
## #_8_fv_ltrkfhfwbfib_fhfathb          #8_8
##           1              2
##           #8_8_jdtk          #8_8_jdtk_flfvbfyc
##           2              2
##           #8_fk            #8_fk_bc
##           1              1
##           #8_fk_bc_yt          #8_fv
##           1              1
```

```
## Last 10 rows
tail(dat_udhr_corpus_tok_no_punct_ngram, 10)
```

```
## .
##           - - -          -          1          - -          - - -          1
##           1              1              1              1              1
##           -          - - -          1          -          1              1
##           - -          - - -          1
##           1              1
```

5.5.3.3.2 Skip-grams

Skip-grams allow to obtain non consecutive n-grams

```
dat_udhr_corpus_tok_no_punct_ngram_skip <- tokens_ngrams(dat_udhr_corpus_tok_no_punct, n = 2:4, s
  unlist() %>%
  tolower() %>%
  table()
## Top 10 rows
head(dat_udhr_corpus_tok_no_punct_ngram_skip, 10)
```

```
## .

5.5.3.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_dat_udhr <- dictionary(list(Human = c("Human*", "people"),
                                bad_aspects = c("tyranny", "barbarous", "oppression", "disregard")))
print(dict_dat_udhr)
```

5.5.3.4.1 Create dictionary

```
## Dictionary object with 2 key entries.
## - [Human]:
##   - human*, people
## - [bad_aspects]:
```

```
## - tyranny, barbarous, oppression, disregard
```

```
dat_udhr_corpus_tok_no_punct_dict_toks <- tokens_lookup(dat_udhr_corpus_tok_no_punct, c
print(dat_udhr_corpus_tok_no_punct_dict_toks)
```

5.5.3.4.2 Token lookup

```
## Tokens consisting of 13 documents and 2 docvars.

5.5.3.5 Part of Speech tagging

Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

5.5.3.5.1 Download and load language models Before using the PoS-tagger, we need to download a language model. As you can see from typing `?udpipe_download_model`, there are 65 languages trained on 101 treebanks from here

Because we have 13 languages in our document, we can download the language models for all of the ones available.

These are the models available: - chinese: chinese-gsd - czech: czech-cac - danish: danish-ddt - english: english-ewt - french: french-partut - georgian: NO language model! - greek: greek-gdt - hungarian: hungarian-szeged - icelandic: NO language model! - irish: irish-idt - japanese: japanese-gsd - russian: russian-gsd - vietnamese: vietnamese-vtb

With the function below, we check if the file exists and if this is the case, we load it; otherwise, we download it and load it later on

```
file_to_check <- list("models/chinese-gsd-ud-2.5-191206.udpipe", "models/czech-cac-ud-2.5-191206.udpipe",
  "models/danish-ddt-ud-2.5-191206.udpipe", "models/english-ewt-ud-2.5-191206.udpipe",

##          1          1          1
```

5.6.2.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_dat_twitter <- dictionary(list(Tories = c("Tory*", "Conservative*"),
  Labour = c("Socialist*", "Labour*")))
print(dict_dat_twitter)
```

5.6.2.4.1 Create dictionary

```
## Dictionary object with 2 key entries.
## - [Tories]:
##   - tory*, conservative*
## - [Labour]:
##   - socialist*, labour*
```

```
dat_twitter_corpus_tok_no_punct_dict_toks <- tokens_lookup(dat_twitter_corpus_tok_no_punct_dict_toks)
print(dat_twitter_corpus_tok_no_punct_dict_toks)
```

5.6.2.4.2 Token lookup

```
## Tokens consisting of 7,504 documents and 42 docvars.
## twitter.json.1 :
## character(0)
##
## twitter.json.2 :

## twitter.json.6      0      0
```

```
## [ reached max_ndoc ... 7,498 more documents ]
```

5.6.2.5 Part of Speech tagging

Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

5.6.2.5.1 Download and load language model Before using the PoS-tagger, we need to download a language model. As you can see from typing `?udpipe_download_model`, there are 65 languages trained on 101 treebanks from here

```
file_to_check <- "models/english-ewt-ud-2.5-191206.udpipe"

if (file.exists(file = file_to_check)){
  m_english <- udpipes_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}else{
  m_english <- udpipes_download_model(model_dir = "models/", language = "english-ewt")
  m_english <- udpipes_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}
```

5.6.2.5.2 Tokenise, tag, dependency parsing We use the already tokenised text, with no punctuations.

```
dat_twitter_anndf <- udpipes_annotate(m_english, x = dat_twitter_corpus_tok_no_punct[[2]]) %>%
  as.data.frame()
## inspect
head(dat_twitter_anndf, 10)
```

5.7.5.3 N-grams

N-grams are a subfamily of compound words. They can be named as “bi-grams”, “tri-grams”, etc. N-grams yield a sequence of tokens from already tokenised text object.

5.7.5.3.1 Multi-grams The code below allows to obtain the sequences of consecutive compound words, with 2, 3 or 4 compound words.

```
web_page_txt_corpus_tok_no_punct_ngram <- tokens_ngrams(web_page_txt_corpus_tok_no_punct_ngram,
  unlist() %>%
  tolower() %>%
  table()
## Top 10 rows
head(web_page_txt_corpus_tok_no_punct_ngram, 10)
```

```
## .
##      $_and      $_and_<      $_and_<_>      <_>      <_>_that
##      1          1          1          1          1
## <_>_that_can      >_that      >_that_can >_that_can_be      >_used
##      1          1          1          1          1
```

```
## Last 10 rows
tail(web_page_txt_corpus_tok_no_punct_ngram, 10)
```

```
## .
##   you're_asking_for_r      you're_likely      you're_likely_to
##           1              1              1
##   you're_likely_to_use      you're_more      you're_more_likely
##           1              1              1
##   you're_more_likely_to      your_current      your_current_r
##           1              1              1
##   your_current_r_session
##           1
```

5.7.5.3.2 Skip-grams Skip-grams allow to obtain non consecutive n-grams

```
web_page_txt_corpus_tok_no_punct_ngram_skip <- tokens_ngrams(web_page_txt_corpus_tok_no_punct_ngram,
  ## Top 10 rows
  head(web_page_txt_corpus_tok_no_punct_ngram_skip[[1]], 10)
```

```
## [1] "Install_the"      "Install_packages" "all_packages"

## [10] "in_tidyverse_running_tidyverse"
```

5.7.5.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_web_page_txt <- dictionary(list(tidy_family = c("tidy*", "ggplot**"),
                                     r_packages = "*r"))
print(dict_web_page_txt)
```

5.7.5.4.1 Create dictionary

```
## Dictionary object with 2 key entries.
## - [tidy_family]:
##   - tidy*, ggplot**
## - [r_packages]:
##   - *r
```

```
web_page_txt_corpus_tok_no_punct_dict_toks <- tokens_lookup(web_page_txt_corpus_tok_no_punct, dict_web_page_txt)
print(web_page_txt_corpus_tok_no_punct_dict_toks)
```

5.7.5.4.2 Token lookup

```
## Tokens consisting of 31 documents.
## text1 :
## [1] "tidy_family" "tidy_family"
##
## text2 :
## [1] "tidy_family" "tidy_family" "r_packages" "r_packages"
```

```
##

##
## text6 :
## [1] "r_packages" "r_packages"
##
## [ reached max_ndoc ... 25 more documents ]
```

```
dfm(web_page_txt_corpus_tok_no_punct_dict_toks)
```

5.7.5.4.3 DFM

```
## Document-feature matrix of: 31 documents, 2 features (35.48% sparse) and 0 docvars.
##           features
## docs      tidy_family r_packages
## text1           2           0
## text2           2           2
## text3           1           0
## text4           3           0
## text5           2           2
## text6           0           2
## [ reached max_ndoc ... 25 more documents ]
```

5.7.5.5 Part of Speech tagging

Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

5.7.5.5.1 Download and load language model Before using the PoS-tagger, we need to download a language model. As you can see from typing `?udpipe_download_model`, there are 65 languages trained on 101 treebanks from here

```
file_to_check <- "models/english-ewt-ud-2.5-191206.udpipe"

if (file.exists(file = file_to_check)){
```

```

m_english <- udpipe_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}else{
  m_english <- udpipe_download_model(model_dir = "models/", language = "english-ewt")
  m_english <- udpipe_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}

```

5.7.5.5.2 Tokenise, tag, dependency parsing We use the already tokenised text, with no punctuations.

```

web_page_txt_anndf <- udpipe_annotate(m_english, x = web_page_txt_corpus_tok_no_punct[[1]]) %>%
  as.data.frame()
## inspect
head(web_page_txt_anndf, 10)

```

```

5.8.6.3 N-grams

N-grams are a subfamily of compound words. They can be named as “bi-grams”, “tri-grams”, etc. N-grams yield a sequence of tokens from already tokenised text object.

5.8.6.3.1 Multi-grams The code below allows to obtain the sequences of consecutive compound words, with 2, 3 or 4 compound words.

```
web_pages_txt_corpus_tok_no_punct_ngram <- tokens_ngrams(web_pages_txt_corpus_tok_no_punct_comp,
  unlist() %>%
  tolower() %>%
  table())
## Top 10 rows
head(web_pages_txt_corpus_tok_no_punct_ngram, 10)
```

```
## .
##      $_cyl      $_cyl_|      $_cyl_|_>      ^_2
##      1          1          1          2
##      ^_2_+      ^_2_+_y      ^_2_>      ^_2_>_select
##      1          1          1          1
##      `_show_col_types` `_show_col_types`=
##      1          1
```

```
## Last 10 rows
tail(web_pages_txt_corpus_tok_no_punct_ngram, 10)

## .
##   zero_length_outputs_learn      zones_leap
##               1                1
##   zones_leap_days      zones_leap_days_daylight
##               1                1
##   zones_with_tz      zones_with_tz_force_tz
##               1                1
##   zones_with_tz_force_tz_time      _license
##               1                1
##   _license_full      _license_full_license
##               1                1
```

5.8.6.3.2 Skip-grams Skip-grams allow to obtain non consecutive n-grams

```
web_pages_txt_corpus_tok_no_punct_ngram_skip <- tokens_ngrams(web_pages_txt_corpus_tok_no_punct,
## Top 10 rows
head(web_pages_txt_corpus_tok_no_punct_ngram_skip[[7]], 10)

## [9] "by_Site_with_2.1.3"              "Hadley_Site_with_2.1.3"
```

5.8.6.4 Dictionary

If you have a dictionary with various words that fall within a generic word (e.g., variants of pronunciation of a word), then you can look these up. Here, we will create a dictionary that we populate ourselves and we show how to use it to search for items

```
dict_web_pages_txt <- dictionary(list(tidy_family = c("tidy*", "ggplot*"),
                                     r_packages = "*r"))
print(dict_web_pages_txt)
```

5.8.6.4.1 Create dictionary

```
## Dictionary object with 2 key entries.
## - [tidy_family]:
##   - tidy*, ggplot**
## - [r_packages]:
##   - *r
```

```
web_pages_txt_corpus_tok_no_punct_dict_toks <- tokens_lookup(web_pages_txt_corpus_tok_no_punct, tidy_family, r_packages)
print(web_pages_txt_corpus_tok_no_punct_dict_toks)
```

5.8.6.4.2 Token lookup

```

```

5.8.6.5 Part of Speech tagging

Part-of-Speech tagging (or PoS-Tagging) is used to distinguish different part of speech, e.g., the sentence: “Jane likes the girl” can be tagged as “Jane/NNP likes/VBZ the/DT girl/NN”, where NNP = proper noun (singular), VBZ = 3rd person singular present tense verb, DT = determiner, and NN = noun (singular or mass). We will use the `udpipe` package

5.8.6.5.1 Download and load language model Before using the PoS-tagger, we need to download a language model. As you can see from typing `?udpipe_download_model`, there are 65 languages trained on 101 treebanks from here

```
file_to_check <- "models/english-ewt-ud-2.5-191206.udpipe"

if (file.exists(file = file_to_check)){
  m_english <- udpipes_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}else{
  m_english <- udpipes_download_model(model_dir = "models/", language = "english-ewt")
  m_english <- udpipes_load_model(file = "models/english-ewt-ud-2.5-191206.udpipe")
}
```

5.8.6.5.2 Tokenise, tag, dependency parsing We use the already tokenised text, with no punctuations.

```
web_pages_txt_anndf <- udpipe_annotate(m_english, x = web_pages_txt_corpus_tok_no_punct)
  as.data.frame()
## inspect
head(web_pages_txt_anndf, 10)
```

```

Chapter 6

Corpus analysis and statistics

In this chapter, we will continue using R for the qualitative analyses of textual corpora.

After manipulating the various corpora, we use statistical analyses to provide a statistical account of the corpora. We will use the **quanteda** package to compute various statistics, including simple frequency analyses, lexical diversity, keyness, collocations, word clouds, network analyses and we will end with Poisson regression that is adapted for count data.

6.1 Loading packages

```
### Use the code below to check if you have all required packages installed. If some are not installed
requiredPackages = c('tidyverse', 'tidytext', 'rvest', 'janeaustenr', 'proustr', 'textdata', 'gut')
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p)
  library(p,character.only = TRUE)
}
```

```
## Loading required package: wordcloud
```

```
## Loading required package: RColorBrewer
```

```
## Loading required package: quanteda.textstats
```

6.2 janeaustenr

6.2.1 Import into Global Environment

Adding data from the first book into the Global Environment

```
data(sensesensibility)
#data(prideprejudice)
#data(mansfieldpark)
#data(emma)
#data(northangerabbey)
#data(persuasion)
```

6.2.2 Look into data

And we can get the top 60 rows from “sensesensibility”

```
sensesensibility %>%
  head(n = 60)
```

```

##
## text5 :
## [1] "surrounding" "acquaintance" "late" "owner" "estate"
## [6] "single"
##
## text6 :
## [1] "lived" "advanced" "age"
##
## [ reached max_ndoc ... 10,586 more documents ]
```

6.2.7 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.2.7.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.2.7.1.1 DFM We start by generating a DFM (document-feature matrix)

```
sensesensibility_corpus_tok_no_punct_no_Stop_dfm <- dfm(sensesensibility_corpus_tok_no_punct_no_S
sensesensibility_corpus_tok_no_punct_no_Stop_dfm
```

```
## Document-feature matrix of: 10,592 documents, 5,894 features (99.95% sparse) and 0 docvars.
##           features
## docs  family dashwood settled sussex estate residence norland park centre
## text1      1      1      1      1      1      0      0      0      0
## text2      0      0      0      0      0      1      1      1      1
## text3      0      0      0      0      0      0      0      0      0
## text4      0      0      0      0      0      0      0      0      0
## text5      0      0      0      0      1      0      0      0      0
## text6      0      0      0      0      0      0      0      0      0

6.2.7.1.3 Plot We plot the top 15 most frequent words used in the text.

```
sensesensitivity_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
```

```
geom_point() +
coord_flip() +
labs(x = NULL, y = "Frequency") +
theme_minimal()
```

6.2.7.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.2.7.2.1 TTR (Type-Token Ratio)

```
sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.2.7.2.1.1 Computing TTR

```
## document TTR
## 1 text1 1
## 2 text2 1
## 3 text3 1
## 4 text4 1
## 5 text5 1
```

```
plot(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr$TTR, type = "l", xaxt = "r",
     grid())
axis(1, at = seq_len(nrow(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr)), las = 1)
```

6.2.7.2.1.2 Plotting TTR

6.2.7.2.2 CTTR (Corrected Type-Token Ratio)

```
sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr <- textstat_lexdiv(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
head(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr, 5)
```

6.2.7.2.2.1 Computing CTTR

```
##      document      CTTR
## 1    text1 1.581139
## 2    text2 1.414214
## 3    text3 1.224745
## 4    text4 1.414214
## 5    text5 1.732051
```

```
plot(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr$CTTR, type = "l", xaxt = "r",
     grid())
axis(1, at = seq_len(nrow(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr)), las = 1)
```

6.2.7.2.2.2 Plotting TTR

6.2.7.2.3 K (Yule's K)

```
sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K <- textstat_lexdiv(sens
head(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K, 5)
```

6.2.7.2.3.1 Computing K

```
## document      K
## 1    text1 2.775558e-13
## 2    text2 0.000000e+00
## 3    text3 0.000000e+00
## 4    text4 0.000000e+00
## 5    text5 0.000000e+00
```

```
plot(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K$K, type = "l", xax
grid()
axis(1, at = seq_len(nrow(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdi
```

6.2.7.2.3.2 Plotting K

Index

6.2.7.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.2.7.3.1 Computing keyness

##	feature	chi2	p	n_target	n_reference
## 1	sussex	1.896954e+02	0.000000e+00	1	8
## 2	estate	8.935737e+01	0.000000e+00	1	18

## 10	14	-1.457513e-04	9.903676e-01	0	1

```
textplot_keyness(sensesensibility_corpus_tok_no_punct_no_Stop_dfm_tstat_key, margin = 0.2)
```

6.2.7.3.2 Plotting

6.2.7.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lambda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

```
sensesensibility_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(sensesensibility_corpus_tok_no_punct_no_Stop_tstat_col_caps)
```

##	collocation	count	count_nested	length	lambda	z	p_value
## 1	sir john	94	0	2	8.403435	25.821983	0.000000e+00
## 2	colonel brandon	96	0	2	8.710609	22.451536	0.000000e+00
## 3	lady middleton	75	0	2	9.790296	20.341377	0.000000e+00

## 9	colonel brandon's	20	0	2	7.900226	9.286110	0.000000e+00
## 10	lady middleton's	12	0	2	7.836180	8.991984	0.000000e+00

```
## 11      harley street      16          0          2 10.338940  7.134778 4.847234e-13
## 12      sir john's       14          0          2  8.886429  6.162402 3.582473e-10
```

6.2.7.5 Word clouds

We can use word clouds of the top 100 words

```
set.seed(132)
sensesensitivity_corpus_tok_no_punct_no_Stop_dfm %>%
  textplot_wordcloud(max_words = 100, color = brewer.pal(8, "Dark2"))
```

6.2.7.6 Network of feature co-occurrences

A Network of feature co-occurrences allows to obtain association plot of word usage. We use an fcm (feature co-occurrence matrix) based on our DFM.

```
set.seed(144)
sensesensitivity_corpus_tok_no_punct_no_Stop_dfm %>%
  dfm_trim(min_termfreq = 100) %>%
  textplot_network(min_freq = 0.5)
```

6.2.7.7 Poisson regression

Finally, we run a GLM with a poisson family to evaluate the significance level of our most frequent words.

```
sensesensibility_corpus_GLM <- sensesensibility_corpus_tok_no_punct_no_Stop_dfm_freq %>%
  filter(frequency >= 100) %>%
  glm(frequency ~ feature, data = ., family = "poisson")
summary(sensesensibility_corpus_GLM)
```

6.2.7.7.1 Computing GLM

```
##

## Number of Fisher Scoring iterations: 2
```

6.2.7.7.2 Visualising coefficients

6.2.7.7.2.1 A plot We use two functions from the package `ggstats`. Because we used a poisson distribution, we obtain the results in IRR (=Incident rate ratios). Usually, we need to exponentiate these to make sense of the results.

```
ggcoef_model(sensesensibility_corpus_GLM, exponentiate = TRUE)
```

```
ggcoef_table(sensesensitivity_corpus_GLM, exponentiate = TRUE)
```

6.2.7.7.2.2 A plot + a table + 95% CI

6.3 proustr

6.3.1 Import into Global Environment

Adding data from the first book into the Global environment

```
data(ducotedechezswann)
#data(alombredesjeunesfillesenfleurs)
#data(lecotedeguermantres)
#data(sodomeetgomorrhe)
#data(laprisonnire)
#data(albertinedisparue)
#data(letempretrouve)
```

6.3.2 Look into data

And we can get the top 60 rows from the first one

```
ducotedechezswann %>%
  head(n = 60)
```

```
## # A tibble: 60 x 4

6.3.5 Stop words

It is best to remove stop words (function/grammatical words) when we use statistical analyses of a corpus.

```
ducotedechezswann_corpus_tok_no_punct_no_Stop <- tokens_select(ducotedechezswann_corpus_tok_no_punct_no_Stop, stopwords)
```

```
## Tokens consisting of 1,004 documents and 3 docvars.

6.3.6 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.3.6.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.3.6.1.1 DFM We start by generating a DFM (document-feature matrix)

```
ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm <- dfm(ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm)
ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm

## Document-feature matrix of: 1,004 documents, 16,494 features (99.62% sparse) and 3 documents
##           features
## docs   couché bonne heure peine bougie éteinte yeux fermaient vite n'avais
## text1      1      1      2      1      1      1      3      1      1      2
## text2      0      0      0      0      0      0      0      0      0      0
## text3      0      0      0      0      0      0      1      0      1      1
## text4      0      0      0      1      0      0      1      0      0      0
## text5      1      0      0      1      0      0      0      0      0      0
## text6      0      0      0      0      0      0      0      0      0      0
## [ reached max_ndoc ... 998 more documents, reached max_nfeat ... 16,484 more features ]
```

```
ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_freq <- textstat_frequency(ducotedechezswann_co
ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_freq

6.3.6.1.3 Plot We plot the top 15 most frequent words used in the text.

```
ducotedecheszmann_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency") +
  theme_minimal()
```

6.3.6.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.3.6.2.1 TTR (Type-Token Ratio)

```
ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(
  head(ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.3.6.2.1.1 Computing TTR

```
## document      TTR

6.3.6.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.3.6.3.1 Computing keyness

##	feature	chi2	p	n_target	n_reference
## 1	réflexions	200.1189	0	2	4
## 2	prochaine	149.3483	0	2	6

## 9	inaccoutumés	134.3997	0	1	0
## 10	l'excitation	134.3997	0	1	0

```
textplot_keyness(ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_tstat_key, margin = 0.2)
```

6.3.6.3.2 Plotting

6.3.6.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lambda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

```
ducotedechezswann_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(ducotedechezswann_corpus_tok_no_punct_no_Stop_tstat_col_caps)
```

##	collocation	count	count_nested	length	lambda	z	p_value

6.3.6.5 Word clouds

We can use word clouds of the top 100 words

```
set.seed(132)
ducotedecheswann_corpus_tok_no_punct_no_Stop_dfm %>%
  textplot_wordcloud(max_words = 100, color = brewer.pal(8, "Dark2"))
```

6.3.6.6 Network of feature co-occurrences

A Network of feature co-occurrences allows to obtain association plot of word usage. We use an fcm (feature co-occurrence matrix) based on our DFM.

```
set.seed(144)
ducotedecheswann_corpus_tok_no_punct_no_Stop_dfm %>%
  dfm_trim(min_termfreq = 200) %>%
  textplot_network(min_freq = 0.5)
```

6.3.6.7 Poisson regression

Finally, we run a GLM with a poisson family to evaluate the significance level of our most frequent words.

```
ducotedechezswann_corpus_GLM <- ducotedechezswann_corpus_tok_no_punct_no_Stop_dfm_freq
  filter(frequency >= 200) %>%
  glm(frequency ~ feature, data = ., family = "poisson")
summary(ducotedechezswann_corpus_GLM)
```

6.3.6.7.1 Computing GLM

```

6.4.5 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.4.5.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.4.5.1.1 DFM We start by generating a DFM (document-feature matrix)

```
dat_inaug_corpus_tok_no_punct_no_Stop_dfm <- dfm(dat_inaug_corpus_tok_no_punct_no_Stop)
dat_inaug_corpus_tok_no_punct_no_Stop_dfm
```

```
## Document-feature matrix of: 5 documents, 1,580 features (73.63% sparse) and 3 docvars.

6.4.5.1.3 Plot We plot the top 15 most frequent words used in the text.

```
dat_inaug_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency") +
  theme_minimal()
```

6.4.5.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.4.5.2.1 TTR (Type-Token Ratio)

```
dat_inaug_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(dat_inaug_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
head(dat_inaug_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.4.5.2.1.1 Computing TTR

```
##           document      TTR

```

6.4.5.2.3.2 Plotting K

6.4.5.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
dat_inaug_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(dat_inaug_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.4.5.3.1 Computing keyness

##	feature	chi2	p	n_target	n_reference

textplot_keyness(dat_inaug_corpus_tok_no_punct_no_Stop_dfm_tstat_key, margin = 0.2)
```

6.4.5.3.2 Plotting

6.4.5.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lamda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

```
dat_inaug_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(dat_inaug_corpus_tok_no_punct_no_Stop_tstat_col_caps)
dat_inaug_corpus_tok_no_punct_no_Stop_tstat_col_caps
```

```

6.4.5.7.2 Visualising coefficients

6.4.5.7.2.1 A plot We use two functions from the package `ggstats`. Because we used a poisson distribution, we obtain the results in IRR (=Incident rate ratios). Usually, we need to exponentiate these to make sense of the results.

```
ggcoef_model(dat_inaug_corpus_GLM, exponentiate = TRUE)
```

```
ggcoef_table(dat_inaug_corpus_GLM, exponentiate = TRUE)
```

6.4.5.7.2.2 A plot + a table + 95% CI

● p <= 0.05 ○ p > 0.05

6.5 Universal Declaration of Human Rights

We import multiple files containing the Universal Declaration of Human Rights in 13 languages. There are 13 different textfiles

6.5.1 Importing data

```
dat_udhr <- readtext(paste0(Data_Dir, "/txt/UDHR/*"),
                     docvarsfrom = "filenames",
                     docvarnames = c("document", "language"))
```

6.5.2 Create a corpus

```
dat_udhr_corpus <- corpus(dat_udhr)
print(dat_udhr_corpus)

## Corpus consisting of 13 documents and 2 docvars.

6.5.5 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.5.5.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.5.5.1.1 DFM We start by generating a DFM (document-feature matrix)

```
dat_udhr_corpus_tok_no_punct_no_Stop_dfm <- dfm(dat_udhr_corpus_tok_no_punct_no_Stop)
dat_udhr_corpus_tok_no_punct_no_Stop_dfm

## Document-feature matrix of: 13 documents, 7,526 features (91.89% sparse) and 2 docvars.
##
## features

6.5.5.1.3 Plot We plot the top 15 most frequent words used in the text.

```
dat_udhr_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency") +
  theme_minimal()
```

6.5.5.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.5.5.2.1 TTR (Type-Token Ratio)

```
dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.5.5.2.1.1 Computing TTR

```
##           document      TTR
## 1 UDHR_chinese.txt 0.2260597
## 2  UDHR_czech.txt 0.5698925
## 3  UDHR_danish.txt 0.4215886
## 4 UDHR_english.txt 0.5384615
## 5  UDHR_french.txt 0.4095890
```

```
plot(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr$TTR, type = "l", xaxt = "n", yaxt = "n",
     grid()
     axis(1, at = seq_len(nrow(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr)),
```

6.5.5.2.1.2 Plotting TTR

6.5.5.2.2 CTTR (Corrected Type-Token Ratio)

```
dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr <- textstat_lexdiv(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr, 5)
```

6.5.5.2.2.1 Computing CTTR

```
##           document      CTTR
## 1 UDHR_chinese.txt  8.068778
## 2  UDHR_czech.txt 14.011708
## 3  UDHR_danish.txt 11.441296
## 4 UDHR_english.txt  9.803845
## 5  UDHR_french.txt 11.066486
```

```
plot(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr$CTTR, type = "l", xaxt = "n", xlab = "Index", ylab = "CTTR", grid())
axis(1, at = seq_len(nrow(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr)), labels = c("UDHR_chinese.txt", "UDHR_czech.txt", "UDHR_danish.txt", "UDHR_english.txt", "UDHR_french.txt"))
```

6.5.5.2.2 Plotting TTR

6.5.5.2.3 K (Yule's K)

```
dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K <- textstat_lexdiv(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K, 5)
```

6.5.5.2.3.1 Computing K

```
##          document      K
## 1 UDHR_chinese.txt 102.90030
## 2 UDHR_czech.txt  48.51948
## 3 UDHR_danish.txt 110.11513
## 4 UDHR_english.txt 63.92626
## 5 UDHR_french.txt  76.35579
```

```
plot(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K$K, type = "l", xaxt = "n",
      grid()
      axis(1, at = seq_len(nrow(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K)), 1
```

6.5.5.2.3.2 Plotting K

Index

6.5.5.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.5.5.3.1 Computing keyness

##	feature	chi2	p	n_target	n_reference
## 1	771.9803	0	148	38	
## 2	562.2424	0	80	0	
## 3	471.6133	0	97	31	
## 4	454.6676	0	66	1	
## 5	442.4049	0	63	0	
## 6	216.4382	0	32	0	
## 7	209.4186	0	31	0	
## 8	202.3998	0	30	0	
## 9	202.3998	0	30	0	
## 10	199.1636	0	41	13	

```
textplot_keyness(dat_udhr_corpus_tok_no_punct_no_Stop_dfm_tstat_key, margin = 0.2)
```

6.5.5.3.2 Plotting

6.5.5.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lambda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

```
dat_udhr_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(dat_udhr_corpus_t
dat_udhr_corpus_tok_no_punct_no_Stop_tstat_col_caps
```

6.5.5.5 Word clouds

We can use word clouds of the top 100 words

```
set.seed(132)
dat_udhr_corpus_tok_no_punct_no_Stop_dfm %>%
  textplot_wordcloud(max_words = 100, color = brewer.pal(8, "Dark2"))
```

6.5.5.6 Network of feature co-occurrences

A Network of feature co-occurrences allows to obtain association plot of word usage. We use an fcm (feature co-occurrence matrix) based on our DFM.

```
set.seed(144)
dat_udhr_corpus_tok_no_punct_no_Stop_dfm %>%
  dfm_trim(min_termfreq = 20) %>%
  textplot_network(min_freq = 0.5)
```

```
## Warning: ggrepel: 23 unlabeled data points (too many overlaps). Consider
## increasing max.overlaps
```

```
dat_udhr_corpus_GLM <- dat_udhr_corpus_tok_no_punct_no_Stop_dfm_freq %>%
  filter(frequency >= 50) %>%
  glm(frequency ~ feature, data = ., family = "poisson")
summary(dat_udhr_corpus_GLM)
```

```

```

6.5.5.7.2 Visualising coefficients

6.5.5.7.2.1 A plot We use two functions from the package `ggstats`. Because we used a poisson distribution, we obtain the results in IRR (=Incident rate ratios). Usually, we need to exponentiate these to make sense of the results.

6.6.2.4 Unique variable names (for volume)

```
unique(docvars(dat_twitter_corpus, field = "lang"))
```

```
## [1] "en" "tl" "und" "fr" "ja" "de" "sv" "hu" "ht" "lt" "cy" "ar"
## [13] "pt" "in" "fi" "tr" "es" "hi" "fa" "it" "pl"
```

6.6.3 Tokens

`tokens()` segments texts in a corpus into tokens (words or sentences) by word boundaries. We can remove punctuations or not

6.6.3.1 With punctuations

```
dat_twitter_corpus_tok <- tokens(dat_twitter_corpus)
dat_twitter_corpus_tok
```

```
## Tokens consisting of 7,504 documents and 42 docvars.
## twitter.json.1 :
## [1] "@EFC_Jayy" "UKIP"
##
## twitter.json.2 :
## [1] "RT" "@Corbynator2" ":" "@jeremycorbyn"
## [5] "Reaction" "from" "people" "at"
## [9] "the" "Watford" "Rally" ":"

##
## [ reached max_ndoc ... 7,498 more documents ]
```

6.6.4 Stop words

It is best to remove stop words (function/grammatical words) when we use statistical analyses of a corpus.

```
dat_twitter_corpus_tok_no_punct_no_Stop <- tokens_select(dat_twitter_corpus_tok_no_punct_no_Stop, stopwords())
dat_twitter_corpus_tok_no_punct_no_Stop
```

```
## Tokens consisting of 7,504 documents and 42 docvars.
## twitter.json.1 :
## [1] "@EFC_Jayy" "UKIP"
##
## twitter.json.2 :
## [1] "RT"                "@Corbynator2"  "@jeremycorbyn" "Reaction"
## [5] "people"           "Watford"       "Rally"          "Jeremy"
## [9] "Corbyn"           "Jeremy"        "#GE2017"        "#GE17"
## [ ... and 2 more ]
##
## twitter.json.3 :
## [1] "RT"                "@ryvr"
## [3] "Stephen"           "Hawking"
## [5] "world's"           "smartest"
## [7] "Jeremy"            "Corbyn"
## [9] "https://t.co/2kl3ayLd44" "#TuesdayThoughts"
##
## twitter.json.4 :
## [1] "RT"                "@TheGreenParty"

```

6.6.5 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.6.5.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.6.5.1.1 DFM We start by generating a DFM (document-feature matrix)

```
dat_twitter_corpus_tok_no_punct_no_Stop_dfm <- dfm(dat_twitter_corpus_tok_no_punct_no_Stop)
dat_twitter_corpus_tok_no_punct_no_Stop_dfm

## Document-feature matrix of: 7,504 documents, 12,235 features (99.92% sparse) and 42 docvars.
##               features
## docs           @efc_jayy ukip rt @corbynator2 @jeremycorbyn reaction people
## twitter.json.1          1  1  0              0              0          0  0
## twitter.json.2          0  0  1              1              1          1  1
## twitter.json.3          0  0  1              0              0          0  0
## twitter.json.4          0  0  1              0              0          0  0
## twitter.json.5          0  0  1              0              0          0  0
## twitter.json.6          0  1  1              0              0          0  0

6.6.5.1.3 Plot We plot the top 15 most frequent words used in the text.

```
dat_twitter_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency") +
  theme_minimal()
```

6.6.5.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.6.5.2.1 TTR (Type-Token Ratio)

```
dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.6.5.2.1.1 Computing TTR

```
##          document      TTR
## 1 twitter.json.1 1.0000000
## 2 twitter.json.2 0.9230769
```

```
## 3 twitter.json.3 1.0000000
## 4 twitter.json.4 0.9090909
## 5 twitter.json.5 1.0000000
```

```
plot(dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr$TTR, type = "l", xaxt = "n", xlab = "Index",
     grid()
     axis(1, at = seq_len(nrow(dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr)), labels = paste0("twitter.json.", 1:nrow(dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr))))
```

6.6.5.2.1.2 Plotting TTR

Index

6.6.5.2.2 CTTR (Corrected Type-Token Ratio)

```

6.6.5.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(dat_twitter_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.6.5.3.1 Computing keyness

6.6.5.3.2 Plotting

6.6.5.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lambda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

```
dat_twitter_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(dat_twitter_corpus_tok_no_punct_no_Stop_tstat_col_caps)
dat_twitter_corpus_tok_no_punct_no_Stop_tstat_col_caps
```

6.6.5.5 Word clouds

We can use word clouds of the top 100 words

```
set.seed(132)
dat_twitter_corpus_tok_no_punct_no_Stop_dfm %>%
  textplot_wordcloud(max_words = 100, color = brewer.pal(8, "Dark2"))
```

```
## Warning in text.default(x1, y1, word[i], cex = (1 + adjust) * size[i], offset =
```

0, : font metrics unknown for Unicode character U+1F602

6.6.5.6 Network of feature co-occurrences

A Network of feature co-occurrences allows to obtain association plot of word usage. We use an fcm (feature co-occurrence matrix) based on our DFM.

```
set.seed(144)
dat_twitter_corpus_tok_no_punct_no_Stop_dfm %>%
  dfm_trim(min_termfreq = 500) %>%
  textplot_network(min_freq = 0.5)
```

6.6.5.7 Poisson regression

Finally, we run a GLM with a poisson family to evaluate the significance level of our most frequent words.

```
dat_twitter_corpus_GLM <- dat_twitter_corpus_tok_no_punct_no_Stop_dfm_freq %>%
  filter(frequency >= 500) %>%
  glm(frequency ~ feature, data = ., family = "poisson")
summary(dat_twitter_corpus_GLM)
```

```

6.7.5 Tokens

`tokens()` segments texts in a corpus into tokens (words or sentences) by word boundaries. We can remove punctuations or not

6.7.5.1 With punctuations

```
web_page_txt_corpus_tok <- tokens(web_page_txt_corpus)
web_page_txt_corpus_tok
```

```
## Tokens consisting of 31 documents.

6.7.7 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.7.7.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.7.7.1.1 DFM We start by generating a DFM (document-feature matrix)

```
web_page_txt_corpus_tok_no_punct_no_Stop_dfm <- dfm(web_page_txt_corpus_tok_no_punct_no_Stop_dfm)
```

```
## Document-feature matrix of: 31 documents, 223 features (95.37% sparse) and 0 docvars
##           features
## docs  install packages tidyverse running install.packages library load core
## text1      1          1          2          1          1          0          0          0
## text2      0          0          2          0          0          1          1          1
## text3      0          0          1          0          0          0          0          0
## text4      0          2          3          0          0          0          0          2
## text5      0          0          0          0          0          0          0          0
## text6      0          0          0          0          0          0          0          0

```

6.7.7.1.3 Plot We plot the top 15 most frequent words used in the text.

```
web_page_txt_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency") +
  theme_minimal()
```

6.7.7.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.7.7.2.1 TTR (Type-Token Ratio)

```
web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(web_p
head(web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.7.7.2.1.1 Computing TTR

```
## document      TTR
## 1    text1 0.8333333
## 2    text2 0.8571429
## 3    text3 1.0000000
## 4    text4 0.6923077
## 5    text5 0.8947368
```

```
plot(web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr$TTR, type = "l", xaxt = "n", xlab = "Index", yaxt = "n", ylab = "TTR", grid())

axis(1, at = seq_len(nrow(web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K))
```

6.7.7.2.3.2 Plotting K

6.7.7.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.7.7.3.1 Computing keyness

##	feature	chi2	p	n_target	n_reference
## 1	install	13.83568364	0.000199511	1	0
## 2	install.packages	13.83568364	0.000199511	1	0
## 3	running	13.83568364	0.000199511	1	0
## 4	tidyverse	6.36092880	0.011666046	2	13
## 5	packages	0.65583008	0.418035953	1	9
## 6	\$	-0.01754298	0.894628443	0	1
## 7	1.3.0	-0.01754298	0.894628443	0	1
## 8	<	-0.01754298	0.894628443	0	1
## 9	additional	-0.01754298	0.894628443	0	1
## 10	aesthetics	-0.01754298	0.894628443	0	1

```
textplot_keyness(web_page_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_key, margin = 0.2)
```

6.7.7.3.2 Plotting

6.7.7.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lambda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

Here, we do not have any compound words!

```
web_page_txt_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(web_page_txt_corpus_tok_no_punct_no_Stop_tstat_col_caps)
```

```
## [1] collocation count count_nested length lambda
## [6] z p_value
## <0 rows> (or 0-length row.names)
```

6.7.7.5 Word clouds

We can use word clouds of the top 100 words

```
set.seed(132)
web_page_txt_corpus_tok_no_punct_no_Stop_dfm %>%
```

```
textplot_wordcloud(max_words = 100, color = brewer.pal(8, "Dark2"))
```

6.7.7.6 Network of feature co-occurrences

A Network of feature co-occurrences allows to obtain association plot of word usage. We use an fcm (feature co-occurrence matrix) based on our DFM.

```
set.seed(144)
web_page_txt_corpus_tok_no_punct_no_Stop_dfm %>%
  dfm_trim(min_termfreq = 3) %>%
  textplot_network(min_freq = 0.5)
```

6.7.7.7 Poisson regression

Finally, we run a GLM with a poisson family to evaluate the significance level of our most frequent words.

```
web_page_txt_corpus_GLM <- web_page_txt_corpus_tok_no_punct_no_Stop_dfm_freq %>%
  filter(frequency >= 3) %>%
  glm(frequency ~ feature, data = ., family = "poisson")
summary(web_page_txt_corpus_GLM)
```

6.7.7.7.1 Computing GLM

```
##

6.7.7.7.2 Visualising coefficients

6.7.7.7.2.1 A plot We use two functions from the package `ggstats`. Because we used a poisson distribution, we obtain the results in IRR (=Incident rate ratios). Usually, we need to exponentiate these to make sense of the results.

```
ggcoef_model(web_page_txt_corpus_GLM, exponentiate = TRUE)
```

```
ggcoef_table(web_page_txt_corpus_GLM, exponentiate = TRUE)
```

6.7.7.7.2.2 A plot + a table + 95% CI

6.8.8 Statistical analyses

We can start by providing statistics (whether descriptives or inferential) based on our corpora.

6.8.8.1 Simple frequency analysis

Here we look at obtaining a simple frequency analysis of usage.

6.8.8.1.1 DFM We start by generating a DFM (document-feature matrix)

```
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm <- dfm(web_pages_txt_corpus_tok_no_punct,
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm
```

```
## Document-feature matrix of: 9 documents, 1,176 features (80.94% sparse) and 4 docvars.
##           features
## docs      skip content ggplot24.0.1 started reference news releases version 4.0.0
## text1      1         1           1         1           1         1           1       12      1
## text2      1         1           0         1           1         1           1       10      0
## text3      1         1           0         1           1         1           1       13      0
## text4      1         1           0         1           1         1           2         8      1
## text5      1         1           0         1           1         1           1         6      0

6.8.8.1.3 Plot We plot the top 15 most frequent words used in the text.

```
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm %>%
  textstat_frequency(n = 15) %>%
  ggplot(aes(x = reorder(feature, frequency), y = frequency)) +
  geom_point() +
  coord_flip() +
  labs(x = NULL, y = "Frequency") +
  theme_minimal()
```

6.8.8.2 Lexical diversity

We can compute the lexical diversity in a document. This is a measure allowing us to provide a statistical account of diversity in the choice of lexical items in a text. See the different measures implemented here

6.8.8.2.1 TTR (Type-Token Ratio)

```
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr <- textstat_lexdiv(web_
head(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr, 5)
```

6.8.8.2.1.1 Computing TTR

```
##      document      TTR
## 1    text1 0.6180758
## 2    text2 0.4936709
## 3    text3 0.6146497
## 4    text4 0.5466238
## 5    text5 0.6635514
```

```
plot(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_ttr$TTR, type = "l", x
grid()
axis(1, at = seq_len(nrow(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_t
```

6.8.8.2.1.2 Plotting TTR

6.8.8.2.2 CTTR (Corrected Type-Token Ratio)

```
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr <- textstat_lexdiv(web_
head(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr, 5)
```

6.8.8.2.2.1 Computing CTTR

```
##      document      CTTR
## 1    text1 8.094198
## 2    text2 7.599967
```

```
## 3    text3 7.701538
## 4    text4 9.639816
## 5    text5 6.863829
```

```
plot(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr$CTTR, type = "l", xaxt = "n",
     grid())
axis(1, at = seq_len(nrow(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_cttr)), labels =
```

6.8.8.2.2.2 Plotting TTR

6.8.8.2.3 K (Yule's K)

```
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K <- textstat_lexdiv(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K, 5)
```

6.8.8.2.3.1 Computing K

```
##    document      K
## 1    text1 99.10836
## 2    text2 76.55468
## 3    text3 83.57337
## 4    text4 60.17308
## 5    text5 90.83763
```

```
plot(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K$K, type = "l", xaxt = "n", xlab = "Index",
     grid())
axis(1, at = seq_len(nrow(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_lexdiv_K)), labels =
```

6.8.8.2.3.2 Plotting K

6.8.8.3 Keyness - relative frequency analysis

The relative frequency analysis allows to provide a statistical analysis of frequent words as a function of a target reference level. For this dataset, we do not have a specific target. Hence the comparison is done based on the full dataset.

```
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_key <- textstat_keyness(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_key, 10)
```

6.8.8.3.1 Computing keyness

##	feature	chi2	p	n_target	n_reference
## 1	ggplot2	234.98239	0.000000e+00	26	2
## 2	faq	61.00858	5.662137e-15	7	0
## 3	graphics	61.00858	5.662137e-15	7	0
## 4	chang	20.53116	5.866844e-06	3	0
## 5	kara	20.53116	5.866844e-06	3	0
## 6	lin	20.53116	5.866844e-06	3	0

## 8	winston	20.53116	5.866844e-06	3	0
## 9	woo	20.53116	5.866844e-06	3	0
## 10	author	19.34380	1.091731e-05	10	20

```
textplot_keyness(web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_tstat_key, margin = 0.2)
```

6.8.8.3.2 Plotting

6.8.8.4 Collocations - scoring multi-word expressions

A collocation analysis is a way to identify contiguous collocations of words, i.e., multi-word expressions. Depending on the language, these can be identified based on capitalisation (e.g., proper names) as in English texts. However, this is not the same across languages.

We look for capital letters in our text. The result provides Wald's Lambda and z statistics. Usually, any z value higher or equal to 2 is statistically significant. To compute p values, we use the probability of a normal distribution based on a mean of 0 and an SD of 1. This is appended to the table.

```
web_pages_txt_corpus_tok_no_punct_no_Stop_tstat_col_caps <- tokens_select(web_pages_txt_corpus_tok_no_punct_no_Stop_tstat_col_caps)
web_pages_txt_corpus_tok_no_punct_no_Stop_tstat_col_caps
```

##	collocation	count	count_nested	length	lambda	z	p_value
## 1	pak pak	12	0	2	7.082777	11.371583	0.000000e+00
## 2	hadley wickham	18	0	2	12.606207	6.260750	1.915649e-10
## 3	code conduct	13	0	2	8.624086	5.915232	1.657036e-09

6.8.8.5 Word clouds

We can use word clouds of the top 100 words

```
set.seed(132)
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm %>%
  textplot_wordcloud(max_words = 100, color = brewer.pal(8, "Dark2"))
```

```
set.seed(144)
web_pages_txt_corpus_tok_no_punct_no_Stop_dfm %>%
  dfm_trim(min_termfreq = 20) %>%
  textplot_network(min_freq = 0.5)
```

6.8.8.7 Poisson regression

Finally, we run a GLM with a poisson family to evaluate the significance level of our most frequent words.

```
web_pages_txt_corpus_GLM <- web_pages_txt_corpus_tok_no_punct_no_Stop_dfm_freq %>%
  filter(frequency >= 20) %>%
  glm(frequency ~ feature, data = ., family = "poisson")
summary(web_pages_txt_corpus_GLM)
```

6.8.8.7.1 Computing GLM

```
##
## Call:
## glm(formula = frequency ~ feature, family = "poisson", data = .)
##
## Coefficients:
##
##             Estimate Std. Error z value Pr(>|z|)

```

6.8.8.7.2 Visualising coefficients

6.8.8.7.2.1 A plot We use two functions from the package `ggstats`. Because we used a poisson distribution, we obtain the results in IRR (=Incident rate ratios). Usually, we need to exponentiate these to make sense of the results.

```
ggcoef_model(web_pages_txt_corpus_GLM, exponentiate = TRUE)
```

```
ggcoef_table(web_pages_txt_corpus_GLM, exponentiate = TRUE)
```

6.8.8.7.2.2 A plot + a table + 95% CI

6.9 session info

```
sessionInfo()

Part IV

Data reduction techniques and machine learning

Chapter 7

Reducing Dimensionality: Correlations, Principal Component Analysis, cluster analysis and Multidimensional scaling

In this chapter, we will look at how to reduce dimensionality of our dataset. This is particularly important when you have a large number of predictors and you want to reduce the number of predictors to a smaller set.

When you have multiple predictors (numeric or categorical) that are related to the outcome, you will need a way to assess whether all the predictors are needed. One solution is to use a Generalised Linear Model with all predictors added to the model. This technique, while easy to implement has several drawbacks. We'll see this in more details next week, but usually, when two predictors (or more!) are correlated to various levels, they will cancel each other, and we cannot be sure of how to interpret the results.

We'll use the correlation plots again to verify the correlation level of our predictors and then employ Principal Component Analysis to first reduce dimensionality and then for clustering of outcomes. We then use an alternative approach, a non-supervised cluster analysis and Multidimensional Scaling that allows us to look at our predictors in relation to the outcome. We'll examine how these approaches can help us tackle issues of multicollinearity and of reducing dimensionality.

7.1 Loading packages

```
### Use the code below to check if you have all required packages installed. If some are
requiredPackages = c('tidyverse', 'knitr', 'Hmisc', 'corrplot', 'FactoMineR', 'factoextra')
for(p in requiredPackages){
  if(!require(p,character.only = TRUE)) install.packages(p, dependencies = TRUE)
  library(p,character.only = TRUE)
}
## below to change maximum overlap for the PCA, Cluster and MDS to draw all information
options(ggrepel.max.overlaps = Inf)
```

7.2 Read dataset

The dataset comes from one of my projects; this is a subset from one speaker. It provides acoustic correlates that can be used to distinguish between `guttural` and `non-guttural` consonants. The former group comprises: uvular, pharyngealised and pharyngeal consonants; the latter, plain, velar and glottal. These six classes were produced in three different vowel environments /i: a: u:/. In each class, there were multiple consonants (total 21). Acoustic measurements are used to quantify supralaryngeal (formant distances on the Bark scale) and laryngeal (voice quality) measurements.

```
dfPharV2 <- read_csv("data/dfPharV2.csv")
```

```
## Rows: 402 Columns: 25
## -- Column specification -----
## Delimiter: ","
## chr (2): contextN, context
## dbl (23): CPP, Energy, H1A1c, H1A2c, H1A3c, H1H2c, H2H4c, H2KH5Kc, H42Kc, HN...
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```

7.3 Correlation tests

Above, we did a correlation test on two predictors. What if we want to obtain a nice plot of all numeric predictors and add significance levels? We use the package `corrplot`

7.3.1 Correlation plots

7.3.1.1 Correlation plots 1

```
corr <-
  dfPharV2 %>%
  select(where(is.numeric)) %>%
  cor() %>%
  print()
```

```

```
corrplot(corr, method = 'ellipse', type = 'upper')
```

7.3.1.2 Correlation plots 2

Let's first compute the correlations between all numeric variables and plot these with the p values

```
### correlation using "corrplot"
### based on the function `rcorr` from the `Hmisc` package
### Need to change dataframe into a matrix
corr <-
  dfPharV2 %>%
  select(where(is.numeric)) %>%
  data.matrix(dfPharV2) %>%
  rcorr(type = "pearson")
print(corr)
```

```

```

7.3.2 Reduce dimensionality by selecting uncorrelated predictors

We can use the package `recipes` to allow us to only select uncorrelated predictors at a particular level. For this to work, we need to create a recipe with our outcome. Let's say we want to use `context` as our outcome to be predicted from all available predictors in the dataset `dfPharV2`. We select all variables. Let us test various R^2 values between all numeric predictors, at 0.9, 0.75, 0.5, 0.25 and 0.1. Any comments?

7.3.2.1 $R^2 = 0.9$

```
dim(dfPharV2)[2]-1
```

```
## [1] 24
```

```
rec <- dfPharV2 %>%
  recipe(context ~ .) %>%
```

```

step_corr(all_numeric_predictors(), threshold = 0.9) %>%
prep()
bake(rec, new_data = dfPharV2)

```

This first solution allowed us to reduce the number of predictors from 23 (removing word and the outcome context) to a maximum of 4 predictors (+context).

The problem with this approach is that it depends on the decision of what to consider as an optimal value for R^2 ! The second solution is to use PCA to reduce dimensionality. This is a more robust approach as it allows us to reduce the number of predictors without having to make arbitrary decisions on what R^2 value to use.

7.4 Principal Component Analyses - PCA

For this next step, we use PCA to first reduce dimensionality. PCA works by choosing a maximum number of dimensions that is always close to number of predictors - 1. Then you need to make decisions on how many dimensions to retain (usually, those with a variance explained of 5% and above).

The dimensions are all decorrelated from each other.

7.4.1 Model specification

We use the package `FactoMineR` to run our PCA. We use all acoustic measures as predictors and our qualitative variable as the `context`.

```
dfPharPCA <- dfPharV2 %>%
  column_to_rownames(var = "contextN")
dfPharPCA
```

```

```
pcaDat1 <- PCA(dfPharPCA,
               quali.sup = 1,
               graph = TRUE,
               scale.unit = TRUE, ncp = 5)
```

7.4.2 Scree plot

This shows the percent explained variance for our PCs. This is equivalent to the normalized eigenvalues of the covariance matrix used in PCA. Traditionally, any PC that explained 5% or above of the variance can be retained. In our example below, we know that the first 2 dimensions explain most of the variance, with the third dimension contributing more than 10%.

```
fviz_eig(pcaDat1)
```

```
## Warning in geom_bar(stat = "identity", fill = barfill, color = barcolor, :  
## Ignoring empty aesthetic: `width`.
```

7.4.3 Results

7.4.3.1 Summary of results

Based on the summary of results, we observe that the first 5 dimensions account 88.3% of the variance in the data; each contribute individually to more than 5% of the variance (the fifth is at 4.97%).

```
summary(pcaDat1)
```

```
##
## Call:
## PCA(X = dfPharPCA, scale.unit = TRUE, ncp = 5, quali.sup = 1,
##      graph = TRUE)

```

PCA 3-D Scatterplot

Using the PCA approach allowed us to separate the two contexts and showed that we can use up to five dimensions to explain the results.

7.4.5 Automatic analysis of the PCA results

The `Investigate` function from the `factoInvestigate` package allows to obtain an automatic analysis of the PCA an automatic analysis of the PCA results. It will generate an HTML report that we can import below. The report includes the PCA results, detection of outliers, evaluation of inertia (or % cumulative variance explained), in addition to a description of the top significant dimensions. It also provides a classification via clustering of the predictors, and an evaluation of the results. It should be noted that “*This interpretation of the results was carried out automatically, it cannot match the quality of a personal interpretation*”

```
Investigate(pcaDat1, file = "outputs/Investigate.Rmd", language = "en")
```

```
## -- creation of the .Rmd file (time spent : 0s) --
##
## -- detection of outliers (time spent : 0s) --
## 0 outlier(s) terminated
##
## -- analysis of the inertia (time spent : 0.02s) --
## 4 component(s) carrying information : total inertia of 83.3%
##
## -- components description (time spent : 27.76s) --
## plane 1:2
## plane 3:4
##
## -- classification (time spent : 28.16s) --
## 3 clusters
##
## -- annexes writing (time spent : 28.24s) --

## it cannot match the quality of a personal interpretation
```

```
webshot::webshot(url = "outputs/Investigate.html", file = "outputs/Investigate.png", v
```

Principal Component Analysis

Desvar-empirica

The selected variables and individuals are in variables. The qualitative variables are considered as indicators.

1. Study of the outliers

The analysis of the graphs does not detect any outlier.

2. Inertia distribution

The analysis of the first dimension shows that there are strong relationships between variables and suggests the number of dimensions that should be studied.

The first two dimensions of inertia account for 86.86% of the total inertia, that is, that 86.86% of the individuals are variables (total inertia) is explained by the plane. This percentage is relatively high and thus the first plane will represent the data variables. This value is strongly greater than the maximum value of eigenvalue 10.000, this is usually considered the value for the first plane (significant the difference with the second plane) and the third dimension is not significant. The third plane will represent only the last 13.14% of the inertia of the variables.

From these observations, it should be better to also integrate the dimensions greater or equal to the first one.

Figure 1: Description of the first plane

An analysis of the first plane of inertia is relevant suggests to restrict the analysis to the description of the first 2 axes. These axes present an almost identical profile from the individuals to the 3D space of the variables (95.19% against 93.29%). This observation suggests that only these axes are carrying a great information. As a consequence, the description will stand to these axes.

3. Description of the plane 1-2

Figure 3.1: Individuals factor map (PCA). The selected individuals are those with the higher contribution to the plane construction.

Figure 3.2: Individuals factor map (PCA). The selected individuals are those with the higher contribution to the plane construction. The individuals are represented by their categories for the variable gender.

Figure 3.3: Variables factor map (PCA). The selected variables are those the best shown on the plane.

Figure 3.4: Quadratic factor map (PCA). The selected factors are those the best shown on the plane.

4. Description of the plane 3-4

Figure 4.1: Individuals factor map (PCA). The selected individuals are those with the higher contribution to the plane construction.

Figure 4.2: Individuals factor map (PCA). The selected individuals are those with the higher contribution to the plane construction. The individuals are represented by their categories for the variable gender.

Figure 4.3: Variables factor map (PCA). The selected variables are those the best shown on the plane.

Figure 4.4: Quadratic factor map (PCA). The selected factors are those the best shown on the plane.

5. Classification

Figure 5: Ascending Hierarchical Classification of the individuals. The classification is made on individuals through 2 clusters.

Annexes

7.4.6 Extracting coordinates

The PCA analysis we used above allowed us to reduce dimensionality from 23 acoustic measures into 5 dimensions. These top five dimensions are orthogonal to each other, i.e., they are not correlated with each other, and hence we can easily reduce the collinearity levels.

What we can do next is to export the coordinates of the PCA analysis and save them on the original dataframe, which we can use further in a linear mixed effects regression or any other tools.

```
PCA_coord <- pcaDat1$ind$coord
PCA_coord <- as.data.frame(PCA_coord)
dfPharPCAFull <- dfPharPCA %>%
  bind_cols(PCA_coord)
dfPharPCAFull %>%
  head(10)
```

7.4.6.0.1 Saving coordinates

```

7.4.6.0.3 Conclusion From the analysis above, it is interesting to note that dimensions 2, 3, and 4 allowed to appropriately distinguish between the two contexts, while dimensions 1 and 5 did not. We can explore the data further by examining the contribution of the various variables to each dimension and what they can tell us.

7.5 Kmeans Clustering

In this section, we explore clustering techniques. These are different from the PCA applied above as these are unsupervised learning algorithms. For the PCA, we told the algorithm that there are two groups in our outcome `context`. Here, we let the algorithm decide how many clusters there are.

7.5.1 Nb Clusters

We compute number of clusters via hierarchical clustering, after applying 500 Monte Carlo (“bootstrap”) samples. We specify 10 as our maximum number of clusters

```
dat1Clust <- dfPharPCA[-1]
set.seed(123)

gap_stat <- clusGap(dat1Clust, FUN = hcut, nstart = 20, K.max = 10, B = 500, spaceH0 = "scaledPCA")
print(gap_stat, method = "Tibs2001SEmax")
```

```
## Clustering Gap statistic ["clusGap"] from call:
## clusGap(x = dat1Clust, FUNcluster = hcut, K.max = 10, B = 500, spaceH0 = "scaledPCA")
## B=500 simulated reference sets, k = 1..10; spaceH0="scaledPCA"
## --> Number of clusters (method 'Tibs2001SEmax', SE.factor=1): 8
##           logW      E.logW      gap      SE.sim

```

The results in the plot above show that the optimal number of clusters is 10! This is not helpful at all; for the moment, this is for demonstration.

7.5.1.1 Computing clusters

Although optimal number of clusters is 10, we perform a kMeans clustering with 2, 3, 4, 5, 6, 7, 8, 9 and 10 clusters. The aim is to evaluate how close (or far) our groups are, and whether the two contexts cluster together.

We use the function `hcut` from the package `factoextra`. This will compute Hierarchical Clustering and Cut the Tree into k clusters. By default, it uses `hc_method = "ward.D2"`, `hc_metric = "euclidean"`. `stand = TRUE` allows for the data to be normalised (z-scored)

```
km.resdat1_2 <- hcut(dat1Clust, 2, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_3 <- hcut(dat1Clust, 3, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_4 <- hcut(dat1Clust, 4, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_5 <- hcut(dat1Clust, 5, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_6 <- hcut(dat1Clust, 6, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_7 <- hcut(dat1Clust, 7, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_8 <- hcut(dat1Clust, 8, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_9 <- hcut(dat1Clust, 9, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
km.resdat1_10 <- hcut(dat1Clust, 10, hc_method = "ward.D2", stand = TRUE, graph = TRUE)
```

```
km.resdat1_2
```

```

7.5.2 Conclusion

Cluster analysis is useful in many cases as it provides insights into how the various predictors interact with each other to allow for clusters to emerge. Given that these are independent of the actual groupings of your dependent variable (context), one can use them to interpret the results in a more in-depth way and allow you to be critical about the original grouping. Do not forget that the two guttural and non-guttural are composed each of three contexts (guttural = uvula, pharyngealised and pharyngeal; non-guttural = plain coronal, velar and glottal). Each of the contexts is produced in an /i: a: u:/ contexts. Hence, cluster analysis, which was restricted to a maximum of 10 clusters, picked this up.

7.6 Multidimensional scaling

In this section, we explore multidimensional scaling. This is another unsupervised learning algorithm. As with cluster analysis, we start by running the MDS algorithm and use Kmeans clustering to allow visualisation of the two-dimensional data. Usually, up to 5 dimensions explain a large percentage of the

variance in the data; in our case, we only go for 2 dimensions to evaluate how the two groups are close (or not) to each other). As with cluster analysis, we could compute number of clusters; something we are not doing here.

7.6.1 Computing MDS

We perform a MDS Clustering with 2 Clusters. We use a Euclidean distance matrix. See [here](#) for details on the available dissimilarity methods.

```
dat1MDS <- dfPharPCA

set.seed(123)

mds.resdat1 <- dat1MDS[-1] %>%
  dist(method = 'euclidean') %>%
  cmdscale() %>%
  as_tibble()
colnames(mds.resdat1) <- c("Dim.1", "Dim.2")

mds.resdat1 %>% head(10)
```

```
## # A tibble: 10 x 2
##   Dim.1 Dim.2
##   <dbl> <dbl>
## 1 -45.4  10.1
## 2 -24.6   1.90
## 3 -52.0   6.85
## 4 -36.1  19.9
## 5 -25.2  11.3
## 6 -40.5  10.1
## 7 -40.8  12.0
## 8 -38.0   3.41
## 9 -30.2  10.3
## 10 -19.5   5.61
```

7.6.2 Kmeans clustering

```
## K-means clustering
clust <- kmeans(mds.resdat1, 2)$cluster %>%
  as.factor()
mds.resdat1 <- mds.resdat1 %>%
  mutate(groups = clust)
mds.resdat1$context <- dat1MDS$context
```

7.6.3 Plot

```
## Plot and color by groups
ggscatter(mds.resdat1, x = "Dim.1", y = "Dim.2", col = "context",
  label = NULL,
  color = "context",
  palette = c("red", "blue"),
  size = 2,
  ellipse = TRUE,
  ellipse.type = "convex",
  repel = FALSE,
  shape = "context",
  point = FALSE,
  mean.point = TRUE)
```

7.7 session info

```
sessionInfo()
```

```

Chapter 8

Decision trees and Random Forests

This chapter provides details of how to grow Random Forests for phonetic data. This is not exclusive to phonetic data and can be used for any other type of data.

We will start by looking at the basics of predictive modelling. We will look at some issues with logistic regression related to collinearity and multicollinearity. In **chapter 2**, we looked at various notions obtained from Signal Detection Theory in **section 2.6.4**. We will use these to evaluate the performance of our models. We introduce decision trees to understand how they work, before attempting to replicate how Random Forests work. We then grow our first Random Forests using the **party** and the **ranger** packages and try to capture as much information as possible from it. At the end, we look at the approach advocated by **tidymodels**.

8.1 What is predictive modelling

The majority of research in phonetics and linguistics looks at traditional statistical techniques to evaluate group differences, using either frequentist or Bayesian frameworks. What is important in these frameworks is to assess whether a particular outcome can be explained by the potential differences that exist in a predictor. For example, we may want to examine if the differences observed in F2 frequency at the vowel midpoint can be explained by place of articulation, or age or gender. For this we use a linear regression (with or without mixed effects modelling) with the following formula: `lm(F2 ~ place + age + gender)`.

This approach can potentially explain the differences associated with the predictors, i.e., we evaluate their influence on the outcome. But let's ask the following

question: can the observed differences on F2 frequency at the vowel midpoint be predictive of group differences associated with gender? Let's put it differently: can we predict gender differences based on F2 frequencies? What would happen in the future? This is where predictive modelling comes to the rescue.

Predictive modelling is a statistical technique that uses either traditional or machine learning approaches to evaluate group differences and how they inform group separation. They can be used to predict changes either on the current data or in the future. If you build a predictive model based on pre-existing data, you can use the model's predictions to:

1. Validate the results on the current set
2. Predict results on new ranges (e.g., if you have results on age group 30-50, in theory, you could predict the patterns for age 20 or 70)
3. Predict results on new data, either on the testing set or any new data you obtain in the future.

To understand this further, we will start with a simple Generalised Linear Model predicting context separation from a production task, before moving to Decision Trees and Random Forests. We previously used a Generalised Linear Model to predict perception of grammaticality as a classification tool in **chapter 2.6.4.5**

8.2 Loading packages

```
### Use the code below to check if you have all required packages installed. If some are
requiredPackages = c('tidyverse', 'broom', 'knitr', 'party', 'ranger', 'doFuture', 'tidy
for(p in requiredPackages){
  if(!require(p, character.only = TRUE)) install.packages(p, dependencies = TRUE)
  library(p, character.only = TRUE)
}
options(ggrepel.max.overlaps = Inf)
```

8.3 Read dataset

```
dfPharV2 <- read_csv("data/dfPharV2.csv")

## Rows: 402 Columns: 25
## -- Column specification -----
## Delimiter: ","
## chr (2): contextN, context
## dbl (23): CPP, Energy, H1A1c, H1A2c, H1A3c, H1H2c, H2H4c, H2KH5Kc, H42Kc, HN...
##
## i Use `spec()` to retrieve the full column specification for this data.
## i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

```
dfPharV2

```

8.4 GLM as a classification tool

8.4.1 Model specification

Let's run a first GLM (Generalised Linear Model). A GLM uses a special family “binomial” as it assumes the outcome has a binomial distribution. In general, results from a Logistic Regression are close to what we get from SDT.

We will use the same dataset that comes from phonetic research. This dataset is from my current work on the **phonetic basis of the guttural natural class in Levantine Arabic**. Acoustic analyses were conducted on multiple portions of the VCV sequence, and we report here the averaged results on the first half of V2. Acoustic metrics were obtained via VoiceSauce: various acoustic metrics of supralaryngeal (bark difference) and laryngeal (voice quality via amplitude harmonic differences, noise, energy) were obtained. A total of 23 different acoustic metrics were obtained from 10 participants. Here, we use the data from the first two participants for demonstration purposes (one male and one female). The grouping factor of interest is context with two levels: **guttural** vs **non-guttural**. Gutturals include uvular, pharyngealised and pharyngeal consonants; non-gutturals include coronal plain, velar and glottal consonants.

The aim of the study was to evaluate whether the combination of the acoustic metrics provides support for a difference between the two classes of gutturals vs non-gutturals.

We run a GLM with `context` as our outcome, and `Z2-Z1` as our predictor. We want to evaluate whether the two classes can be separated when using the acoustic metric `Z2-Z1`. `Context` has two levels, and this will be considered as a binomial distribution.

```
mdl.glm.Z2mnZ1 <- dfPharV2 %>%
  glm(context ~ Z2mnZ1, data = ., family = binomial)

## 2 Z2mnZ1      -0.123

## to only get the coefficients
mycoef2 <- tidy(mdl.glm.Z2mnZ1) %>% pull(estimate)
```

8.4.2 Plogis

The result above shows that when moving from the `non-guttural` (intercept), a unit increase (i.e., `guttural`) yields a statistically significant decrease in the log odds associated with Z2-Z1. We can evaluate this further from a classification point of view, using `plogis`.

```
## non-guttural
plogis(mycoef2[1])

## [1] 0.622722

#guttural
plogis(mycoef2[1] + mycoef2[2])

## [1] 0.5934644
```

The `plogis` function provides the probability of being in the `guttural` class. The intercept (non-guttural) is 0.5, and the `guttural` class is 0.41. This means that the model predicts that a unit increase in Z2-Z1 yields a decrease of 9% in the probability of being in the `guttural` class. This is a small effect, but it is statistically significant. The model also provides the log odds associated with the predictor. The log odds are the natural logarithm of the odds ratio, which is the ratio of the probability of being in one class over the other. The log odds are not easy to interpret, but they can be used to evaluate the effect of the predictor on the outcome. The log odds for Z2-Z1 is -0.1, which means that a unit increase in Z2-Z1 yields a decrease of 10% in the odds of being in the `guttural` class. This is a small effect, but it is statistically significant.

This shows that Z2-Z1 is able to explain the difference in the `guttural` class with an accuracy of 59%. Let's continue with this model further.

8.4.3 Model predictions

As above, we obtain predictions from the model. Because we are using a numeric predictor, we need to assign a threshold for the `predict` function. The threshold can be thought of as telling the `predict` function to assign any predictions lower than 50% to one group, and any higher to another.

```
pred.glm.Z2mnZ1 <- predict(mdl.glm.Z2mnZ1, type = "response")>0.5

tbl.glm.Z2mnZ1 <- table(pred.glm.Z2mnZ1, dfPharV2$context)
rownames(tbl.glm.Z2mnZ1) <- c("Non-Guttural", "Guttural")
tbl.glm.Z2mnZ1

##
## pred.glm.Z2mnZ1 Non-Guttural Guttural
## Non-Guttural 167 75
## Guttural 55 105
```

```
## from PresenceAbsence
PresenceAbsence::pcc(tbl.glm.Z2mnZ1)
```

```
##          PCC      PCC.sd
## 1 0.6766169 0.0233592
PresenceAbsence::specificity(tbl.glm.Z2mnZ1)
```

```
##      specificity specificity.sd
## 1      0.5833333      0.03684905
PresenceAbsence::sensitivity(tbl.glm.Z2mnZ1)
```

```
##      sensitivity sensitivity.sd
## 1      0.7522523      0.02903959
roc.glm.Z2mnZ1 <- pROC::roc(dfPharV2$context, as.numeric(pred.glm.Z2mnZ1))
```

```
## Setting levels: control = Non-Guttural, case = Guttural
```

```
## Setting direction: controls < cases
roc.glm.Z2mnZ1
```

```
##
## Call:
## roc.default(response = dfPharV2$context, predictor = as.numeric(pred.glm.Z2mnZ1))
##
## Data: as.numeric(pred.glm.Z2mnZ1) in 222 controls (dfPharV2$context Non-Guttural) <
## Area under the curve: 0.6678
pROC::plot.roc(roc.glm.Z2mnZ1, legacy.axes = TRUE)
```

The model above was able to explain the difference between the two classes with an accuracy of 67.7%. It has a slightly low specificity (0.583) to detect **gutturals**, but a slightly high sensitivity (0.752) to reject the **non-gutturals**. Looking at the confusion matrix, we observe that both groups were relatively accurately identified, but we have relatively large errors (or confusions). The AUC is at 0.6678 which is not too high.

Let's continue with GLM to evaluate it further. We start by running a correlation test to evaluate issues with GLM.

8.5 Issues with GLM (and regression analyses in general)

8.5.1 Correlation tests

Below, we look at two predictors that are correlated with each other: Z3-Z2 (F3-F2 in Bark) and A2*-A3* (normalised amplitude differences between harmonics closest to F2 and F3). The results of the correlation test shows the two predictors to negatively correlate with each other at a rate of -0.87.

```
cor.test(dfPharV2$Z3mnZ2, dfPharV2$A2mnA3)
```

```
##
## Pearson's product-moment correlation
##
## data: dfPharV2$Z3mnZ2 and dfPharV2$A2mnA3
```

```
## t = -35.864, df = 400, p-value < 2.2e-16
## alternative hypothesis: true correlation is not equal to 0
## 95 percent confidence interval:
## -0.8947506 -0.8480066
## sample estimates:
##          cor
## -0.8733751
```

```
dfPharV2 %>%
  ggplot(aes(x = context, y = Z3mnZ2)) +
  geom_boxplot() +
  theme_bw()
```

```
dfPharV2 %>%
  ggplot(aes(x = context, y = A2mnA3)) +
  geom_boxplot() +
  theme_bw()
```

8.5. ISSUES WITH GLM (AND REGRESSION ANALYSES IN GENERAL)2815

As we see from the plot, Z3-Z2 is higher in the guttural, whereas A2*-A3* is lower.

8.5.3 GLM on correlated data

8.5.3.1 Model specifications and issues

Let's run a logistic regression as a classification tool to predict the context as a function of each predictor separately and then combined.

```
dfPharV2 %>% glm(context ~ Z3mnZ2, data = ., family = binomial) %>% summary()
```

```
##
## Call:
## glm(formula = context ~ Z3mnZ2, family = binomial, data = .)
##
## Coefficients:

## AIC: 493.41
##
## Number of Fisher Scoring iterations: 4
```

When looking at the three models above, it is clear that the log odd value for Z3-Z2 is positive, whereas it is negative for A2*-A3*. When adding the two predictors together, there is clear **suppression**: the coefficients for both predictors are now negative. The relatively high correlation between the predictors affected the coefficients and changed the direction of the slope; collinearity is harmful for any regression analysis. When we use an interaction term, the coefficients are all negative, leading to confusions in interpreting the results.

8.5.3.2 Checking collinearity

To check for collinearity, we can use the `vif` function from the `car` package. The `vif` stands for the “Variance Inflation Factor (VIF)”. This is a measure of how much the variance of a regression coefficient is increased due to collinearity. A VIF value below 5 indicates that there is low level of collinearity; between 5 and 10, that there is a moderate level of collinearity and above 10 indicates potential collinearity issues.

```
dfPharV2 %>% glm(context ~ Z3mnZ2 + A2mnA3, data = ., family = binomial) %>%
  vif()
```

8.5.3.2.1 Simple model

```
##    Z3mnZ2    A2mnA3
```

```
## 4.319093 4.319093
```

The values here are close to 5, which indicates a moderate level of collinearity. This is appropriate, but it is not ideal either.

```
dfPharV2 %>% glm(context ~ Z3mnZ2 * A2mnA3, data = ., family = binomial) %>%
  vif()
```

8.5.3.2.2 Interaction model

```
## there are higher-order terms (interactions) in this model
## consider setting type = 'predictor'; see ?vif
```

```
##           Z3mnZ2           A2mnA3 Z3mnZ2:A2mnA3
##           7.151205           7.551354          11.244070
```

When using interaction, the vif values no increase to more than 5 for the individual predictors, and to 11 for the interaction

We use the function `check_collinearity()`

```
dfPharV2 %>% glm(context ~ Z3mnZ2 * A2mnA3, data = ., family = binomial) %>%
  check_collinearity()
```

```
## Model has interaction terms. VIFs might be inflated.
## Try to center the variables used for the interaction, or check
## multicollinearity among predictors of a model without interaction terms.
```

```
## # Check for Multicollinearity
```

```
##
```

```
## Moderate Correlation
```

```
##

Collinearity

High collinearity (VIF) may inflate parameter uncertainty

8.5.4 Conclusion

The more complex your regression model becomes, the higher level of collinearity one can see. This is a known issue in regression analyses, and without applying appropriate approaches, e.g., verifying the collinearity in the data; choosing non-correlated predictors, etc., the models become inflated and the confidence in the results becomes reduced.

There are various solutions to this issue, such as removing collinear predictors, using PCA to obtain orthogonal dimension (i.e., non-correlated dimensions), etc.. Another solution is to use decision trees and Random Forest. Both are very well known to deal with collinearity and to make sense of multivariate predictors.

8.6 Decision Trees

Decision trees are a statistical tool that uses the combination of predictors to identify patterns in the data and provides classification accuracy for the model.

The decision tree used is based on **conditional inference trees** that looks at each predictor and splits the data into multiple nodes (branches) through recursive partitioning in a **tree-structured regression model**. Each node is also split into leaves (difference between levels of outcome).

Decision trees via **ctree** does the following:

1. Test global null hypothesis of independence between predictors and outcome.
2. Select the predictor with the strongest association with the outcome measured based on a multiplicity adjusted p-values with Bonferroni correction
3. Implement a binary split in the selected input variable.
4. Recursively repeat steps 1), 2). and 3).

Let's see this in an example using the same dataset. To understand what the decision tree is doing, we will dissect it, by creating one tree with one predictor and move to the next.

8.6.1 Individual trees

8.6.1.1 Tree 1

```
### from the package party
set.seed(42)
tree1 <- dfPharV2 %>%
  ctree(
    context ~ Z2mnZ1,
    data = .)
print(tree1)
```

```
##
##   Conditional inference tree with 4 terminal nodes
##
## Response:  context
## Input:    Z2mnZ1
## Number of observations:  402
##
## 1) Z2mnZ1 <= 9.551456; criterion = 0.999, statistic = 11.678
## 2) Z2mnZ1 <= 6.779068; criterion = 1, statistic = 12.368
## 3) Z2mnZ1 <= 4.004879; criterion = 1, statistic = 56.773
## 4)* weights = 157
## 3) Z2mnZ1 > 4.004879
## 5)* weights = 106
```

```
## 2) Z2mnZ1 > 6.779068
## 6)* weights = 64
## 1) Z2mnZ1 > 9.551456
## 7)* weights = 75
plot(tree1, main = "Conditional Inference Tree ")
```

How to interpret this figure? Let's look at mean values and a plot for this variable. This is the difference between F2 and F1 using the bark scale. Because gutturals are produced within the pharynx (regardless of where), the prediction is that a high F1 and a low F2 will be the acoustic correlates related to this constriction location. The closeness between these formants yields a lower Z2-Z1. Hence, the prediction is as follow: the smaller the difference, the more pharyngeal-like constriction these consonants have (all else being equal!). Let's compute the mean/median and plot the difference between the two contexts.

```
dfPharV2 %>%
  group_by(context) %>%
  summarise(mean = mean(Z2mnZ1),
            median = median(Z2mnZ1),
            count = n())
```

```
## # A tibble: 2 x 4
##   context      mean median count
##   <fct>      <dbl> <dbl> <int>
## 1 Non-Guttural 6.30   5.02  222
## 2 Guttural    5.31   3.84  180
```

```
dfPharV2 %>%
  ggplot(aes(x = context, y = Z2mnZ1)) +
  geom_boxplot()
```

The table above reports the mean and median of Z2-Z1 for both levels of context and the plots show the difference between the two. We have a total of 180 cases in the **guttural**, and 222 in the **non-guttural**. When considering the conditional inference tree output, various splits were obtained. The first is any value higher than 9.55 being assigned to the **non-guttural** class (around 98% of 75 cases) Then, with anything lower than 9.55, a second split was obtained. A threshold of 6.78: higher assigned to **guttural** (around 98% of 64 cases), lower, were split again with a threshold of 4 Bark. A third split was obtained: values lower of equal to 4 Bark are assigned to the **guttural** (around 70% of 157 cases) and values higher than 4 Barks assigned to the **non-guttural** (around 90% of 106 cases).

Dissecting the tree like this allows interpretation of the output. In this example, this is quite a complex case and **ctree** allowed to fine tune the different patterns seen with Now let's look at the full dataset to make sense of the combination of predictors to the difference.

8.6.2 Model 1

```
set.seed(42)
fit <- dfPharV2 %>%
  ctree(
    context ~ .,
    data = .)
print(fit)
```

```
##
## Conditional inference tree with 8 terminal nodes
##

## #   A1mnA3_mean <dbl>, A2mnA3_mean <dbl>
```

We started with `context` as our outcome, and all 23 acoustic measures as predictors. A total of 8 terminal nodes were identified with multiple binary splits in their leaves, allowing separation of the two categories. Looking specifically at the output, we observe a few things.

The first node was based on `A2*-A3*`, detecting a difference between non-gutturals and gutturals. For the first binary split, a threshold of -13.78 Bark was used (mean non guttural = -7.86; mean guttural = -14.58), then for values lower of equal to this threshold, a second split was performed using `Z4-Z3` (mean

non guttural = 1.67; mean guttural = 1.43) with any value smaller and equal to 1.59, then another binary split using H2*-H4*, etc....

Once done, the `ctree` provides multiple binary splits into guttural or non-guttural.

Any possible issues/interesting patterns you can identify? Look at the interactions between predictors.

8.6.2.2 Predictions from the full model

Let's obtain some predictions from the model and evaluate how successful it is in dealing with the data.

```
set.seed(42)
pred.ctree <- predict(fit)
tbl.ctree <- table(pred.ctree, dfPharV2$context)
tbl.ctree

##
## pred.ctree      Non-Guttural Guttural
##   Non-Guttural      194      41
##   Guttural          28     139

PresenceAbsence::pcc(tbl.ctree)

##          PCC      PCC.sd
## 1 0.8283582 0.01882992

PresenceAbsence::specificity(tbl.ctree)

##   specificity specificity.sd
## 1    0.7722222    0.03134731

PresenceAbsence::sensitivity(tbl.ctree)

##   sensitivity sensitivity.sd
## 1    0.8738739    0.02233216

roc.ctree <- pROC::roc(dfPharV2$context, as.numeric(pred.ctree))

## Setting levels: control = Non-Guttural, case = Guttural
## Setting direction: controls < cases
roc.ctree

##
## Call:
## roc.default(response = dfPharV2$context, predictor = as.numeric(pred.ctree))
##
## Data: as.numeric(pred.ctree) in 222 controls (dfPharV2$context Non-Guttural) < 180 cases (dfPharV2$context Guttural)
```

```
## Area under the curve: 0.823
```

```
pROC::plot.roc(roc.ctree, legacy.axes = TRUE)
```

This full model has a classification accuracy of 82.8%. This is not bad!! It has a relatively moderate specificity at 0.772 (at detecting the gutturals) but a high sensitivity at 0.874 (at detecting the non-gutturals). The ROC curve shows the relationship between the two with an AUC of 0.823. This is a good model, but it is not perfect. The confusion matrix shows that the model was able to detect 80% of the gutturals, but 20% were misclassified as non-gutturals. The opposite is true for the non-gutturals: 80% were detected, but 20% were misclassified as gutturals. The AUC is at 0.823, which is not too bad. ### Random selection

One important issue is that the trees we grew above are biased. They are based on the full dataset, which means they are very likely to overfit the data. We did not add any random selection and we only grew one tree each time. If you think about it, is it possible that we obtained such results simply by chance?

What if we add some randomness in the process of creating a conditional inference tree?

We change a small option in `ctree` to allow for random selection of variables, to mimic what Random Forests will do. We use `controls` to specify `mtry = 5`, which is the rounded square root of number of predictors.

8.6.2.3 Model 2

```
set.seed(42)
fit1 <- dfPharV2 %>%
  ctree(
    context ~ .,
    data = .,
    controls = ctree_control(mtry = 5))

plot(fit1, main = "Conditional Inference Tree")
```

```
pred.ctree1 <- predict(fit1)
tbl.ctree1 <- table(pred.ctree1, dfPharV2$context)
tbl.ctree1
```

```
##
## pred.ctree1   Non-Guttural Guttural
## Non-Guttural      205      79
## Guttural          17     101
```

```
PresenceAbsence::pcc(tbl.ctree1)
```

```
##      PCC      PCC.sd
## 1 0.761194 0.0212911
```

```
PresenceAbsence::specificity(tbl.ctree1)
```

```
##      specificity specificity.sd
```

```
## 1    0.5611111    0.03709157
PresenceAbsence::sensitivity(tbl.ctree1)

##      sensitivity sensitivity.sd
## 1    0.9234234    0.01788761
roc.ctree1 <- pROC::roc(dfPharV2$context, as.numeric(pred.ctree1))

## Setting levels: control = Non-Guttural, case = Guttural
## Setting direction: controls < cases
roc.ctree1

##
## Call:
## roc.default(response = dfPharV2$context, predictor = as.numeric(pred.ctree1))
##
## Data: as.numeric(pred.ctree1) in 222 controls (dfPharV2$context Non-Guttural) < 180
## Area under the curve: 0.7423
pROC::plot.roc(roc.ctree1, legacy.axes = TRUE)
```

Can you compare results between you and discuss what is going on?

When adding one random selection process to our `ctree`, we allow it to obtain more robust predictions. We could even go further and grow multiple small trees with a portion of datapoints (e.g., 100 rows, 200 rows). When doing these multiple random selections, you are growing multiple trees that are decorrelated

from each other. These become independent trees and one can combine the results of these trees to come with clear predictions.

This is how Random Forests work. You would start from a dataset, then grow multiple trees, vary number of observations used (`nrow`), and number of predictors used (`mtry`), adjust branches, and depth of nodes and at the end, combine the results in a forest. You can also run permutation tests to evaluate contributions of each predictor to the outcome. This is the beauty of Random Forests. They do all of these steps automatically at once for you!

8.7 Random Forests

As their name indicate, a Random Forest is a forest of trees implemented through bagging ensemble algorithms. Each tree has multiple branches (nodes), and will provide predictions based on recursive partitioning of the data. Then using the predictions from the multiple grown trees, Random Forests will create **averaged** predictions and come up with prediction accuracy, etc.

There are multiple packages that one can use to grow Random Forests:

1. **randomForest**: The original implementation of Random Forests.
2. **party** and **partykit**: using conditional inference trees as base learners
3. **ranger**: a reimplementaion of Random Forests; faster and more flexible than original implementation

The first implementation of Random Forests is widely used in research. One of the issues in this first implementation is that it favoured specific types of predictors (e.g., categorical predictors, predictors with multiple cut-offs, etc.). Random Forests grown via Conditional Inference Trees as implemented in **party** guard against this bias, but they are computationally demanding. Random Forests grown via permutation tests as implemented in **ranger** speed up the computations and can mimic the unbiased selection process.

8.7.1 Party

Random Forests grown via conditional inference trees, are different from the original implementation. They offer an unbiased selection process that guards against overfitting of the data. There are various points we need to consider in growing the forest, including number of trees and predictors to use each time. Let us run our first Random Forest via conditional inference trees. To make sure the code runs as fast as it can, we use a very low number of trees: only 100. It is well known that the more trees you grow, the more confidence you have in the results, as model estimation will be more stable. In this example, I would easily go with 500 trees..

8.7.1.1 Model specification

To grow the forest, we use the function `cforest`. We use all of the dataset for the moment. We need to specify a few options within controls:

1. `ntree = 100` = number of trees to grow. Default = 500.
2. `mtry = round(sqrt(23))`: number of predictors to use each time. Default is 5, but specifying it is advised to account for the structure of the data

By default, `cforest_unbiased` has two additional important options that are used for an unbiased selection process. **WARNING:** you should not change these unless you know what you are doing. Also, by default, the data are split into a training and a testing set. The training is equal to 2/3s of the data; the testing is 1/3.

1. `replace = FALSE` = Use subsampling with or without replacement. Default is `FALSE`, i.e., use subsets of the data without replacing these.
2. `fraction = 0.632` = Use 63.2% of the data in each split.

```
set.seed(42)
mdl.cforest <- dfPharV2 %>%
  cforest(context ~ ., data = .,
          controls = cforest_unbiased(ntree = 100,
                                      mtry = round(sqrt(23))))
```

8.7.1.2 Predictions

To obtain predictions from the model, we use the `predict` function and add `OOB = TRUE`. This uses the out-of-bag sample (i.e., 1/3 of the data).

```
set.seed(42)
pred.cforest <- predict(mdl.cforest, OOB = TRUE)
tbl.cforest <- table(pred.cforest, dfPharV2$context)
tbl.cforest
```

```
##
## pred.cforest   Non-Guttural Guttural
##   Non-Guttural      204      43
##   Guttural         18     137
```

```
PresenceAbsence::pcc(tbl.cforest)
```

```
##          PCC      PCC.sd
## 1 0.8482587 0.01791612
```

```
PresenceAbsence::specificity(tbl.cforest)
```

```
##   specificity specificity.sd
```

```
## 1    0.7611111    0.03187099
PresenceAbsence::sensitivity(tbl.cforest)

##      sensitivity sensitivity.sd
## 1    0.9189189    0.01836125
roc.cforest <- pROC::roc(dfPharV2$context, as.numeric(pred.cforest))

## Setting levels: control = Non-Guttural, case = Guttural
## Setting direction: controls < cases
roc.cforest

##
## Call:
## roc.default(response = dfPharV2$context, predictor = as.numeric(pred.cforest))
##
## Data: as.numeric(pred.cforest) in 222 controls (dfPharV2$context Non-Guttural) < 180 cases (dfPharV2$context Guttural)
## Area under the curve: 0.84
pROC::plot.roc(roc.cforest, legacy.axes = TRUE)
```

Compared with the 82.8% classification accuracy we obtained using `ctree` using our full dataset above (model 1), here we obtain 84.8%; a 2% increase in classification accuracy. The specificity is slightly lower at 0.761 (at detecting the gutturals), but the sensitivity is higher at 0.919 (at detecting the non-gutturals). The ROC curve shows the relationship between the two with an AUC of 0.84.

We could test whether there is statistically significant difference between our `ctree` and `cforest` models. Using the ROC curves, the `roc.test` conducts a non-parametric Z test of significance on the correlated ROC curves. The results show a statistically significant improvement using the `cforest` model. This is normal because we are growing 100 different trees, with random selection of both predictors and samples and provide an averaged prediction.

```
pROC::roc.test(roc.ctree, roc.cforest)

##
## DeLong's test for two correlated ROC curves
##
## data: roc.ctree and roc.cforest
## Z = -0.7417, p-value = 0.4583
## alternative hypothesis: true difference in AUC is not equal to 0
## 95 percent confidence interval:
## -0.06180273 0.02786879
## sample estimates:
## AUC of roc1 AUC of roc2
## 0.823048 0.840015

pROC::roc.test(roc.ctree1, roc.cforest)

##
## DeLong's test for two correlated ROC curves
##
## data: roc.ctree1 and roc.cforest
## Z = -4.2372, p-value = 2.264e-05
## alternative hypothesis: true difference in AUC is not equal to 0
## 95 percent confidence interval:
## -0.14296247 -0.05253302
## sample estimates:
## AUC of roc1 AUC of roc2
## 0.7422673 0.8400150
```

8.7.1.3 Variable Importance Scores

One important feature in `ctree` was to show which predictor was used first in splitting the data, which was then followed by the other predictors. We use a similar functionality with `cforest` to obtain variable importance scores to pinpoint **strong** and **weak** predictors.

There are two ways to obtain this:

1. Simple permutation tests (`conditional = FALSE`)
2. Conditional permutation tests (`conditional = TRUE`)

The former is generally comparable across packages and provides a normal permutation test; the latter runs a permutation test on a grid defined by the correla-

tion matrix and corrects for possible collinearity. This is similar to a regression analysis, but looks at both main effects and interactions.

You could use the normal `varimp` as implemented in `party`. This uses mean decrease in accuracy scores. We will use variable importance scores via an AUC based permutation tests as this uses both accuracy and errors in the model, using `varImpAUC` from the `varImp` package.

DANGER ZONE: using conditional permutation test requires a lot of RAMs, unless you have access to a cluster, and/or a lot of RAMs, do not attempt running it. We will run the non-conditional version here for demonstration.

```
set.seed(42)
VarImp.cforest <- varImp::varImpAUC mdl.cforest, conditional = FALSE)
lattice::barchart(sort(VarImp.cforest))
```

8.7.1.3.1 Non-conditional permutation tests

The Variable Importance Scores via non-conditional permutation tests showed that **A2*-A3*** (i.e., energy in mid-high frequencies around F2 and F3) is the most important variable at explaining the difference between gutturals and non-gutturals, followed by **Z4-Z3** (pharyngeal constriction), **H1*-A3*** (energy in mid-high frequency component), **Z2-Z1** (degree of compactness), **Z3-Z2** (spectral divergence), **H1*-A2** (energy in mid frequency component) and **Z1-Z0** (degree of openness). All other predictors contribute to the contrast but to varying degrees (from **H1*-H2*** to **H1*-A1***). The last 5 predictors are the least important and the CPP has a 0 mean decrease in accuracy and can even be ignored.

8.7.1.3.2 Conditional permutation tests On this relatively small dataset, the conditional permutation tests were relatively fast. Be careful with larger datasets.

```
set.seed(42)
VarImp.cforest <- varImp::varImpAUC(mdl.cforest, conditional = TRUE)
lattice::barchart(sort(VarImp.cforest))
```

8.7.1.4 Conclusion

The **party** package is powerful at growing Random Forests via conditional Inference trees, but is computationally prohibitive when increasing number of trees and using conditional permutation tests of variable importance scores. We look next at the package **ranger** due to its speed in computation and flexibility.

8.7.2 Ranger

8.7.2.1 Declare parallel computing

We start by declaring parallel computing on your devices. This is essential to run these complex computations. The code below is designed to only use 1 core from your machine (and it is not too complex), but if you try to increase the complexity of your computations, you will need parallel computing.

```
set.seed(42)
#Declare parallel computing
```

```

ncores <- availableCores()
cat(paste0("Number of cores available for model calculations set to ", ncores, "."))

## Number of cores available for model calculations set to 12.
registerDoFuture()
makeClusterPSOCK(ncores)

## Socket cluster with 12 nodes on host 'localhost' (R version 4.5.2 (2025-10-31 ucrt), platform
plan(multisession)
ncores

## system
##      12
## below we register our random number generator. This will mostly be used within the tidymodels
## below to suppress any warnings from doFuture
options(doFuture.rng.onMisuse = "ignore")

```

The **ranger** package proposes a reimplementaion of the original Random Forests algorithms, written in C++ and allows for parallel computing. It offers more flexibility in terms of model specification.

8.7.2.2 Model specification

In the model below specification below, there are already a few options we are familiar with, with additional ones described below:

1. **num.tree** = Number of trees to grow. We use the default value
2. **mtry** = Number of predictors to use. Default = `floor(sqrt(Variables))`. For compatibility with **party**, we use `round(sqrt(23))`
3. **replace** = `FALSE` = Use subsampling with or without replacement. Default **replace** = `TRUE`, i.e., is **with** replacement.
4. **sample.fraction** = `0.632` = Use 63.2% of the data in each split. Default is full dataset, i.e., **sample.fraction** = `1`
5. **importance** = `"permutation"` = Compute variable importance scores via permutation tests
6. **scale.permutation.importance** = `FALSE` = whether to scale variable importance scores to be out of 100%. Default is `TRUE`. This is likely to introduce biases in variable importance estimation.
7. **splitrule** = `"extratrees"` = rule used for splitting trees.
8. **num.threads** = allow for parallel computing. Here we only specify 1 thread, but can use all thread on your computer (or cluster).

We use options 2-7 to make sure we have an unbiased selection process with **ranger**. You can try on your own running the model below by using the defaults to see how the rate of classification increases more, but with the caveat that it has a biased selection process.

```

set.seed(42)
mdl.ranger <- dfPharV2 %>%
  ranger(context ~ ., data = ., num.trees = 500, mtry = round(sqrt(23)),
        replace = FALSE, sample.fraction = 0.632,
        importance = "permutation", scale.permutation.importance = FALSE,
        splitrule = "extratrees", num.threads = ncores)
mdl.ranger

```

```

## Ranger result
##
## Call:
##  ranger(context ~ ., data = ., num.trees = 500, mtry = round(sqrt(23)),      replace
##
## Type:                                Classification
## Number of trees:                      500
## Sample size:                          402
## Number of independent variables:      23
## Mtry:                                  5
## Target node size:                     1
## Variable importance mode:             permutation
## Splitrule:                            extratrees
## Number of random splits:              1
## OOB prediction error:                 7.46 %

```

Results of our Random Forest shows an OOB (Out-Of-Bag) error rate of 7.46%, i.e., an accuracy of 92.54%.

8.7.2.3 Going further

Unfortunately, when growing a tree with **ranger**, we cannot use predictions from the OOB sample as there are no comparable options to do so on the predictions. We need to hard-code this. We split the data into a training and a testing sets. The training will be on 2/3s of the data; the testing is on the remaining 1/3.

```

set.seed(42)
train.idx <- sample(nrow(dfPharV2), 2/3 * nrow(dfPharV2))
gutt.train <- dfPharV2[train.idx, ]
gutt.test <- dfPharV2[-train.idx, ]

```

8.7.2.3.1 Create a training and a testing set

8.7.2.3.2 Model specification We use the same model specification as above, except from using the training set and saving the forest (with `write.forest = TRUE`).

```
set.seed(42)
mdl.ranger2 <- gutt.train %>%
  ranger(context ~ ., data = ., num.trees = 500, mtry = round(sqrt(23)),
    replace = FALSE, sample.fraction = 0.632,
    importance = "permutation", scale.permutation.importance = FALSE,
    splitrule = "extratrees", num.threads = ncores, write.forest = TRUE)
mdl.ranger2
```

```
## Ranger result
##
## Call:
##  ranger(context ~ ., data = ., num.trees = 500, mtry = round(sqrt(23)),      replace = FALSE,
##
## Type:                Classification
## Number of trees:      500
## Sample size:          268
## Number of independent variables: 23
## Mtry:                 5
## Target node size:     1
## Variable importance mode: permutation
## Splitrule:            extratrees
## Number of random splits: 1
## OOB prediction error: 10.82 %
```

With the training set, we have an OOB error rate of 10.82%; i.e., an accuracy rate of 89.18%.

8.7.2.3.3 Predictions For the predictions, we use the testing set as a validation set. This is to be considered as a true reflection of the model. This is unseen data not used in the training set.

```
set.seed(42)
pred.ranger2 <- predict(mdl.ranger2, data = gutt.test)
tbl.ranger2 <- table(pred.ranger2$predictions, gutt.test$context)
tbl.ranger2
```

```
##
##           Non-Guttural Guttural
## Non-Guttural         68         7
## Guttural              5        54
```

```
PresenceAbsence::pcc(tbl.ranger2)
```

```
##           PCC      PCC.sd
## 1 0.9104478 0.02475939
```

```

##
## Data: as.numeric(pred.ranger2$predictions) in 73 controls (gutt.test$context Non-Guttural)
## Area under the curve: 0.9084
pROC::plot.roc(roc.ranger, legacy.axes = TRUE)
```

The classification rate based on the testing set is 91.1%. This is comparable to the one we obtained with `cforest`. The changes in the settings allow for similarities in the predictions obtained from both `party` and `ranger`.

8.7.2.3.4 Variable Importance Scores

8.7.2.3.4.1 Default For the variable importance scores, we obtain them from either the training set or the full model above.

```
set.seed(42)
lattice::barchart(sort(mdl.ranger2$variable.importance), main = "Variable Importance scores - tra
```

```
lattice::barchart(sort(mdl.ranger$variable.importance), main = "Variable Importance scores - full
```

Variable Importance scores – full set

There are similarities between `cforest` and `ranger`, with minor differences. Z2-Z1 is the best predictor at explaining the differences between gutturals and non-gutturals with `ranger` followed by Z3-Z2 and then A2*-A3*, (reverse with `cforest`!). The order of the additional predictors is slightly different between the two models. This is expected as the `cforest` model only used 100 trees, whereas the `ranger` model used 500 trees.

A clear difference between the packages `party` and `ranger` is that the former allows for conditional permutation tests for variable importance scores; this is absent from `ranger`. However, there is a debate in the literature on whether correlated data are harmful within Random Forests. It is clear that how Random Forests work, i.e., the randomness in the selection process in number of data points, predictors, splitting rules, etc. allow the trees to be decorrelated from each other. Hence, the conditional permutation tests may not be required. But what they offer is to condition variable importance scores on each other (based on correlation tests) to mimic what a multiple regression analysis does (but without suffering from suppression!). Strong predictors will show major contribution, while weak ones will be squashed giving them extremely low (or even negative) scores. Within `ranger`, it is possible to evaluate this by estimating p values associated with each variable importance. We use the `altman` method. See documentation for more details.

DANGER ZONE: This requires heavy computations. Use with all cores on your machine or in the cluster. Recommendations are to use a minimum of 500 permutations or more, i.e., `num.permutations = 500`; ideally 1000 or more

permutations are needed to get an accurate picture...

```
set.seed(42)
VarImp.pval <- importance_pvalues(mdl.ranger2, method = "altmann",
                                num.permutations = 2000,
                                formula = context ~ ., data = gutt.train,
                                num.threads = ncores)

VarImp.pvaldf <- VarImp.pval %>%
  as.data.frame() %>%
  rownames_to_column(var = "correlate") %>%
  arrange(desc(importance))
VarImp.pvaldf
```

8.7.2.3.4.2 With p values

## 17	HNR25	0.013212121	0.0014992504
## 18	H2H4c	0.013191919	0.0004997501
## 19	FOBark	0.012323232	0.0024987506
## 20	A1mnA2	0.011232323	0.0019990005
## 21	soe	0.008888889	0.0084957521
## 22	HNR05	0.008707071	0.0064967516
## 23	CPP	0.005373737	0.0364817591

Of course, the output above shows variable p values. The lowest is at 0.0004997501 for all predictors; one at 0.0364817591 for CPP. Recall that CPP received the lowest variable importance score within **ranger** and **cforest**.

In the next part, we look at the **tidymodels** and introduce their philosophy.

8.7.3 Random forests with Tidymodels

The `tidymodels` are a bundle of packages used to streamline and simplify the use of machine learning. The `tidymodels` are not restricted to Random Forests, and you can even use them to run simple linear models, logistic regressions, PCA, Random Forests, Deep Learning, etc.

The `tidymodels`' philosophy is to separate data processing on the training and testing sets, and use of a workflow. Below, is an full example of how one can run Random Forests with via `ranger` using the `tidymodels`.

8.7.3.1 Training and testing sets

We start by creating a training and a testing set using the function `initial_split`. Using `strata = context` allows the model to split the data taking into account its structure and splits the data according to proportions of each group.

```
set.seed(42)
train_test_split <-
  initial_split(
    data = dfPharV2,
    strata = "context",
    prop = 0.667)
train_test_split

## <Training/Testing/Total>
## <268/134/402>

train_tbl <- train_test_split %>% training()
test_tbl <- train_test_split %>% testing()
```

8.7.3.2 Set for cross-validation

We can (if we want to), create a 10-folds cross-validation on the training set. This allows to fine tune the training by obtaining the forest with the highest accuracy. This is a clear difference with `ranger`. While it is not impossible to hard code that, `tidymodels` simplify it for us!!

```
set.seed(42)
train_cv <- vfold_cv(train_tbl, v = 10, strata = "context")
```

8.7.3.3 Model Specification

Within the model specification, we need to specify multiple options:

1. A **recipe**: This is the recipe and is related to any data processing one wants to apply on the data.

2. An **engine**: We need to specify the **engine** to use. Here we want to run a Random Forest.
3. A **tuning**: Here we can tune our engine
4. A **workflow**: here we specify the various steps of the workflow

8.7.3.3.1 Recipe When defining the recipe, you need to think of the type of “transformations” you will apply to your data.

1. Z-scoring is the first thing that comes to mind. When you z-score the data, you are allowing all strong and weak predictors to be considered equally by the model. This is important as some of our predictors have very large differences related to the levels of context and have different measurement scales. We could have applied it above, but we need to make sure to apply it separately on both training and testing sets (otherwise, our model suffers from data leakage)
2. If you have any missing data, you can use central imputations to fill in missing data (random forests do not like missing data, though they can work with them).
3. You can apply PCA on all your predictors to remove collinearity before running random forests. This is a great option to consider, but adds more complexity to your model.
4. Finally, if you have categorical predictors, you can transform them into dummy variables using `step_dummy()`: 1s and 2s for binary; or use one-hot-encoding `step_dummy(predictor, one_hot = TRUE)`

See documentations of `tidymodels` for what you can apply!!

```
set.seed(42)
recipe <-
  train_tbl %>%
  recipe(context ~ .) %>%
  step_center(all_predictors(), -all_outcomes()) %>%
  step_scale(all_predictors(), -all_outcomes())

recipePrep <- recipe %>%
  prep()

trainData_baked <- bake(recipePrep, new_data = train_tbl) ## convert to the train data to the new

trainData_prep <- recipe %>%
  prep()

trainData_baked <- bake(trainData_prep, new_data = train_tbl) ## convert to the train data to the new
trainData_baked

## # A tibble: 268 x 24
##       CPP Energy  H1A1c  H1A2c  H1A3c  H1H2c  H2H4c  H2KH5Kc  H42Kc  HNR05
```

```

## #   FOBark <dbl>, A1mnA2 <dbl>, A1mnA3 <dbl>, A2mnA3 <dbl>, context <fct>
```

Once we have prepared the recipe, we can `bake` it to see the changes applied to it.

8.7.3.3.2 Setting the engine We set the engine here as a `rand_forest`. We specify a classification mode. Then, we set an engine with engine specific parameters.

```
set.seed(42)
engine_tidym <- rand_forest(
  mode = "classification",
  engine = "ranger",
  mtry %>% tune(),
  trees %>% tune(),
  min_n = 1
) %>%
  set_engine("ranger", importance = "permutation", sample.fraction = 0.632,
    replace = FALSE, write.forest = T, splitrule = "extratrees",
    scale.permutation.importance = FALSE) ## we add engine specific settings
```

8.7.3.3.3 Settings for tuning If we want to tune the model, then uncomment the lines below. It is important to use an `mtry` that hovers around the `round(sqrt(Variables))`. If you use all available variables, then your forest is biased as it is able to see all predictors. For number of trees, low numbers are not great, as you can easily underfit the data and not produce meaningful results. Large numbers are fine and Random Forests do not overfit (in theory).

The full dataset has around 2000 observations, and 23 predictors (well even more, but let's ignore it for the moment). I tuned `mtry` to be between 4 and 6, and `trees` to be between 1000 and 5000 in a 30 step increment. In total, with a 10-folds cross validation, I grew 30 random forests on each fold for a total of 300 Random Forests on the training set!!! This of course will take a loooooong time

to compute on your computer if using one thread. So use parallel computing or a cluster. When running in the cluster with 20 cores, each with 11GB RAMs, and it took around 260.442 seconds to run with 220GB RAMS! Of course, with smaller RAMs and number of cores, the code will still run but will take longer.

```
set.seed(42)
gridy_tidym <- grid_random(
  mtry() %>% range_set(c(4, 6)),
  trees() %>% range_set(c(1000, 2000)),
  size = 30
)
```

8.7.3.3.4 Workflow Now we define the workflow adding the `recipe` and the `model`.

```
set.seed(42)
wkfl_tidym <- workflow() %>%
  add_recipe(recipe) %>%
  add_model(engine_tidym)
```

8.7.3.3.5 Tuning and running model Here we run the model starting with the workflow, the cross-validation sample, the tuning parameters and asking for specific metrics.

The model below will do the following: 1. Use a 10-folds cross validation on the training test 2. Tune the hyper-parameters to reach the model with the best predictions 3. Within each fold, we grow 30 random forests; we have a total of 300 Random Forests, and we use an ROC-AUC based search for the best performing model

Of course, you could use a larger size to grow more trees, with this will take longer to run!

The model will run for about 2-3 minutes with an 8 cores machine and 32GB of RAMs. For demonstration purposes, the tuning of number of trees is restricted to between 1000 and 2000 trees. This can of course be increased to 5000 trees (or more) depending on the size of the dataset

```
set.seed(42)
system.time(grid_tidym <-
  tune_grid(wkfl_tidym,
    resamples = train_cv,
    grid = gridy_tidym,
    metrics = metric_set(accuracy, roc_auc, sens, spec, f_meas, precision, recall),
    control = control_grid(save_pred = TRUE, parallel_over = NULL))
)
```

```
##      user  system elapsed
```

```
##      0.98      0.28      63.32
```

```
print(grid_tidym)
```

```

8.7.3.4.5 Gains curves This is an interesting features that show how much is gained when looking at various portions of the data. We see a gradual increase in the values. When 50% of the data were tested, around 83% of the results

within the non-guttural class were already identified. The more testing was performed, the more confidence in the results there are and then when 84.96% of the data were tested, 100% of the cases were found.

```
wkfl_tidym_final$.predictions[[1]] %>%
  gain_curve(context, `pred_Non-Guttural`) %>%
  autoplot()
```

```
wkfl_tidym_final$.predictions[[1]] %>%
  roc_curve(context, `pred_Non-Guttural`) %>%
  autoplot()
```

8.7.3.4.6 ROC Curves

This is the end of this chapter introducing Random Forests. We have seen how to run them using `party`, `ranger` and `tidymodels`. The latter is a great package that allows to streamline the process of running machine learning models. It is not restricted to Random Forests, and can be used for any type of model!
